CHAPTER 1: OVERVIEW OF THE PROGRAM AND TANGATAN RIVER

Enrico C. Paringit, Dr. Eng., and Dr. Januel P. Floresca

1.1 Background of the Phil-LIDAR 1 Program

The University of the Philippines Training Center for Applied Geodesy and Photogrammetry (UP-TCAGP) launched a research program entitled “Nationwide Hazard Mapping using LiDAR” or Phil-LiDAR 1, supported by the Department of Science and Technology (DOST) Grant-in-Aid (GiA) Program. The program primarily aimed to acquire a national elevation and resource dataset at sufficient resolution to produce information necessary to support the different phases of disaster management. Particularly, it targeted to operationalize the development of flood hazard models that would produce updated and detailed flood hazard maps for the major river systems in the country.

The program also aimed to produce an up-to-date and detailed national elevation dataset suitable for 1:5,000 scale mapping, with 50 cm and 20 cm horizontal and vertical accuracies, respectively. These accuracies were achieved through the use of the state-of-the-art Light Detection and Ranging (LiDAR) airborne technology procured by the project through DOST.

The implementing partner university for the Phil-LiDAR 1 Program is the Isabela State University (ISU). The ISU was in charge of processing LiDAR data and conducting data validation reconnaissance, cross section, bathymetric survey, validation, river flow measurements, flood height and extent data gathering, flood modeling, and flood map generation for the ten (10) river basins in the Cagayan Valley Region. The university is located at Ilagan City in the Province of Isabela.

1.2 Overview of the Tangatan River Basin

The Tangatan River Basin (Figure 1) is a stream located in the Municipality of Santa Ana, a second-class municipality in the Province of Cagayan, Cagayan Valley, Philippines. It has an estimated terrain elevation above sea level of two (2) meters. According to the 2015 census, it has a population of 32,906 people with a density of seventy five (75) inhabitants per square kilometer or 190 inhabitants per square mile. It is situated in the Northern-Eastern most point of Luzon and includes Palau Island. It is the home of the Cagayan Special Economic Zone and the Naval Base Camilo Osias (Naval Operating Base San Vicente).

The Municipality of Santa Ana is politically subdivided into sixteen (16) barangays: Casagan, Casambalangan, Centro (Poblacion), Diora-Zinungan, Dungeg, Kapanikian, Marede, Palawig, Parada-Batu, Patunungan, Rapuli, San Vicente, Santa Clara, Santa Cruz, Visitacion, and Tangatan. The Municipality of Santa Ana is a mix of agricultural, commercial and agricultural economy. Most of the commercial and industrial activities are done at Port Irene since the Cagayan Special Economic Zone in Casambalangan.

The main stem of the Tangatan River Basin, the Tangatan River, is among the ten (10) river systems in Cagayan Valley. According to the 2015 national census of the Philippine Statistics Authority (PSA), a total of 5,649 persons are residing within the immediate vicinity of the river, which is distributed among barangays Dungeg, Marede, Casagan, Sta. Cruz, and Tangatan in the Municipality of Sta. Ana. The economy of Cagayan Province largely rests on agriculture with rice, corn, and banana as the main crops and products (Philippine Statistics Authority, 2017).

Some of its agricultural and aquatic products are rice, corn, peanut, fish, lumber, shells, etc. Among its natural resources are limestone deposits at Bawac Mountain, coal at Carbon Mountain, Santa Clara and guano deposit in the Kapanikian Cave. Sta. Ana is 158 kilometers from Tuguegarao City. Due to its economic potentials particularly in tourism, travel businessmen who develop the island into a luxurious tourist destination continue to grow in number.

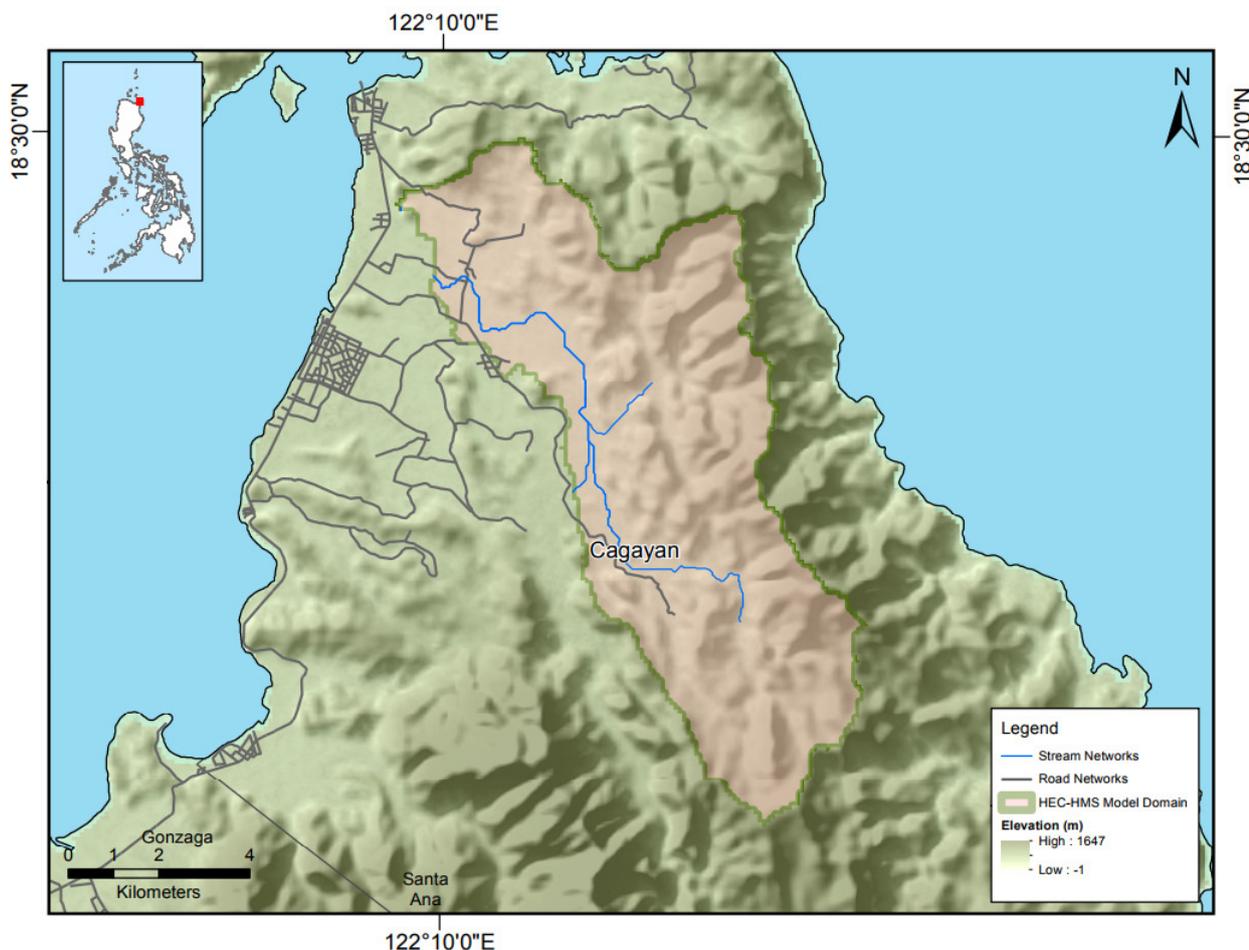

Figure 1. Map of Tangatan River Basin (in brown)

The Tangatan River Basin covers the Municipality of Sta. Ana in Cagayan. The Flood Modelling Component (FMC) of the PHIL-LiDAR 1 Program has computed that the Tangatan River Basin has a drainage area of 67 km².

On October 20, 2016, the Municipality of Sta. Ana was devastated by the Storm Typhoon Lawin with the Storm Signal Number 5. The Mahar Lagmay of Project Noah (Nationwide Operational Assessment of Hazards) urged residents of coastal areas to seek higher ground as the weather bureau expected 2- to 5-meter storm surges, particularly in the towns of Santa Ana, Bugue, Gonzaga and Aparri in the Northern part of Cagayan. Last November 17, 2016, Quibal-Nanguillatan-Baggao provincial road in Cagayan and Abusag Bridge in Baggao Town were not passable due to floods due to heavy rains brought on by the tail-end of a cold front (Visaya, 2016).

According to the disaster risk management agency, with the Lawin's cloud band of 800 kilometers, more than 10 million people across the Northern parts of Luzon were affected. Nevertheless, the areas directly in the typhoon's path were not densely populated and were well-drilled in storm preparations.

CHAPTER 2: LIDAR DATA ACQUISITION OF THE TANGATAN FLOODPLAIN

Engr. Louie P. Balicanta, Engr. Christopher Cruz, Lovely Gracia Acuña, Engr. Gerome Hipolito, Ms. Julie Pearl S. Mars, For. Regina Aedrienne C. Felismino

The methods applied in this Chapter were based on the DREAM methods manual (Sarmiento et al., 2014) and further enhanced and updated in Paringit et al. (2017).

2.1 Flight Plans

Plans were made to acquire LiDAR data within the delineated priority area for Tangatan Floodplain in Antique . Each flight mission has an average of twelve (12) lines which ran for at most four and a half (4.5) hours including take-off, landing and turning time. The flight planning parameters for the LiDAR System is found in Table 1. Figure 1 shows the flight plans and base stations for Tangatan Floodplain.

Table 1. Parameters used in Gemini LiDAR System during Flight Acquisition

Block Name	Flying Height (m AGL)	Overlap (%)	Field of view (ϕ)	Pulse Repetition Frequency (PRF) (kHz)	Scan Frequency (Hz)	Average Speed (kts)	Average Turn Time (Minutes)
CAG2M	800	30	50	100	50	120	5
CAG2Q	1000	30	40	100	50	120	5
CAG2R	1000	30	40	100	50	120	5

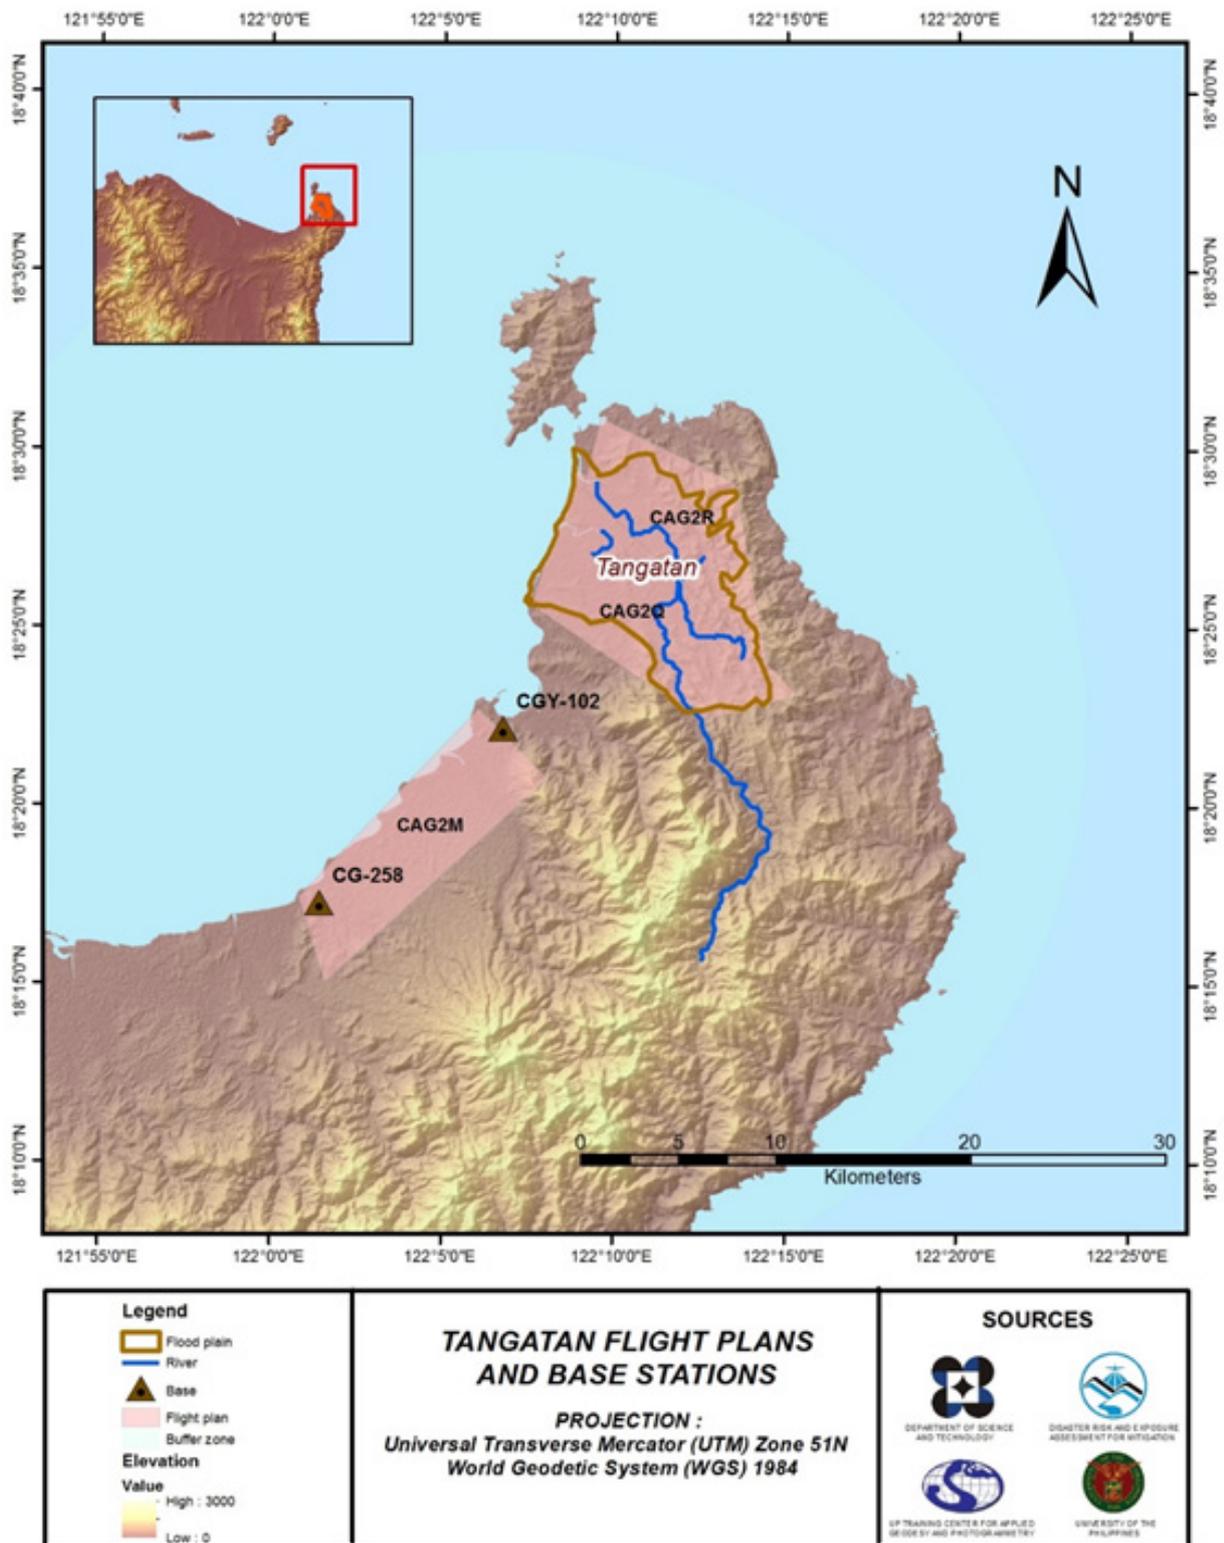

Figure 2. Flight plans and base stations for Tangatan Floodplain

2.2 Ground Base Stations

The Project Team was able to recover One (1) NAMRIA reference point: CGY-102 with second (2nd) order of accuracy. One benchmark reference point: CG-258 with second (2nd) order of accuracy. The certification for the base station is found in Annex 2. These were used as base stations during flight operations for the entire duration of the survey (April 25 to May 9, 2016). Base stations were observed using Dual Frequency GPS Receivers, TRIMBLE SPS 852 and TRIMBLE SPS 985. Flight plans and location of base stations used during the aerial LiDAR Acquisition in Tangatan Floodplain are shown in Figure 2.

Figure 3 to Figure 4 shows the recovered NAMRIA control station within the area. In addition, Tables 2 to 3 show the details about the following NAMRIA control stations and established points, Table 4 shows the list of all ground control points occupied during the acquisition together with the dates they are utilized during the survey.

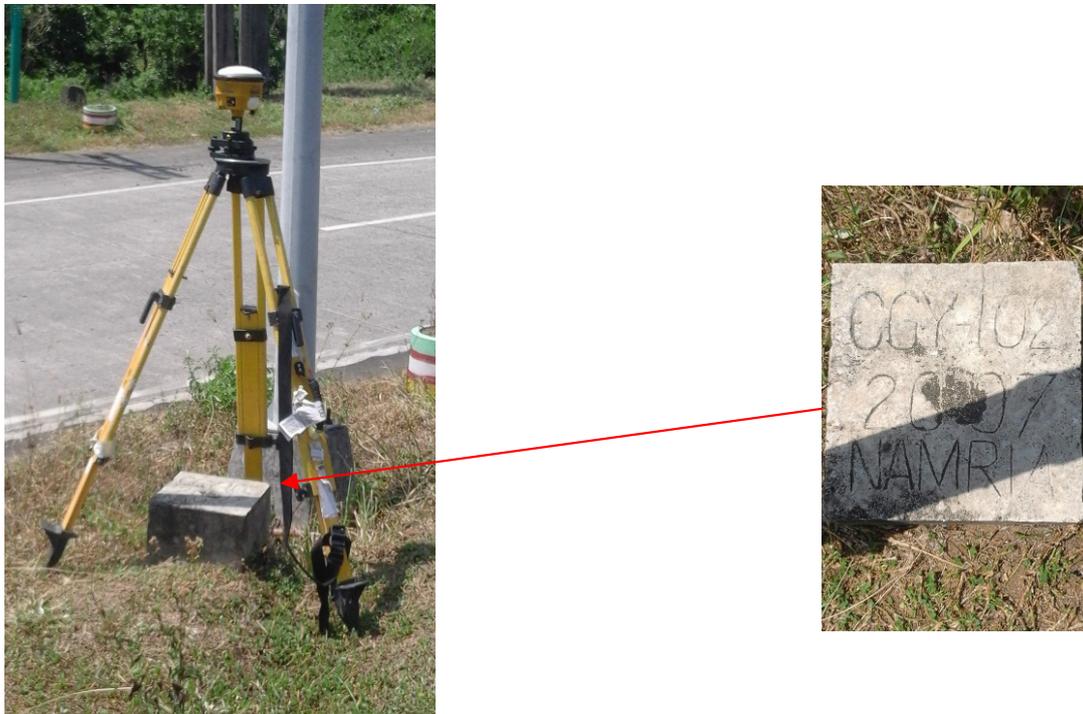

Figure 3. GPS set-up over CGY-102 located about 2 meters from the south corner of the triangular island at the intersection of the national highway and the road to Port Irene at Santa Ana, Cagayan (a) NAMRIA reference point CGY-102 (b) as recovered by field team

2.3 Flight Missions

Four (4) missions were conducted to complete the LiDAR Data Acquisition in Tangatan Floodplain, for a total of fourteen hours and fifty-eight minutes (14+58) of flying time for RP-C9122. All missions were acquired using the Gemini LiDAR System. Table 5 shows the total area of actual coverage per mission and the flying length for each mission and Table 12 presents the actual parameters used during the LiDAR data acquisition.

Table 5. Flight missions for LiDAR data acquisition in Tangatan Floodplain

2.4 Survey Coverage

The Tangatan Floodplain is located in the Provinces of Cagayan with majority of the floodplain situated within the Municipality of Santa Ana. The list of municipalities and cities surveyed with at least one (1) square kilometer coverage, is shown in Table 7. The actual coverage of the LiDAR acquisition for Tangatan Floodplain is presented in Figure 5.

Table 7. List of Municipalities and cities surveyed during Tangatan Floodplain LiDAR survey.

Province	Municipality/ City	Area of Municipality/City (km ²)	Total Area Surveyed (km ²)	Percentage of Area Surveyed
Cagayan	Santa Ana	437.13	223.41	51%
	Gonzaga	497.62	74.67	15%
Total		934.75	298.08	31.89%

CHAPTER 3: LIDAR DATA PROCESSING OF THE TANGATAN FLOODPLAIN

Engr. Ma. Rosario Concepcion O. Ang, Engr. John Louie D. Fabila, Engr. Sarah Jane D. Samalbuero, Engr. Joida F. Prieto, Engr. Edgardo V. Gubatanga Jr., Engr. Analyne M. Naldo, Engr. Velina Angela S. Bemida, Maria Tamsyn C. Malabanan, Engr. Don Matthew B. Banatin, Engr. Sheila-Maye F. Santillan

The methods applied in this Chapter were based on the DREAM methods manual (Ang, et al., 2014) and further enhanced and updated in Paringit, et al. (2017).

3.1 Overview of the LiDAR Data Pre-Processing

The data transmitted by the Data Acquisition Component were checked for completeness based on the list of raw files required to proceed with the pre-processing of the LiDAR data. Upon acceptance of the LiDAR field data, georeferencing of the flight trajectory was done in order to obtain the exact location of the LiDAR sensor when the laser was shot. Point cloud georectification was performed to incorporate correct position and orientation for each point acquired. The georectified LiDAR point clouds were subjected to quality check in order to ensure that the required accuracies of the program, which are the minimum point density, vertical and horizontal accuracies, were met. The point clouds were then classified into various classes before generating Digital Elevation Models such as Digital Terrain Model and Digital Surface Model.

Using the elevation of points gathered in the field, the LiDAR-derived digital models were calibrated. Portions of the river that were barely penetrated by the LiDAR System were replaced by the actual river geometry measured from the field by the Data Validation and Bathymetry Component. LiDAR acquired temporally were then mosaicked to completely cover the target river systems in the Philippines. Orthorectification of images acquired simultaneously with the LiDAR data was done through the help of the georectified point clouds and the metadata containing the time the image was captured.

These processes are summarized in the flowchart shown in Figure 6.

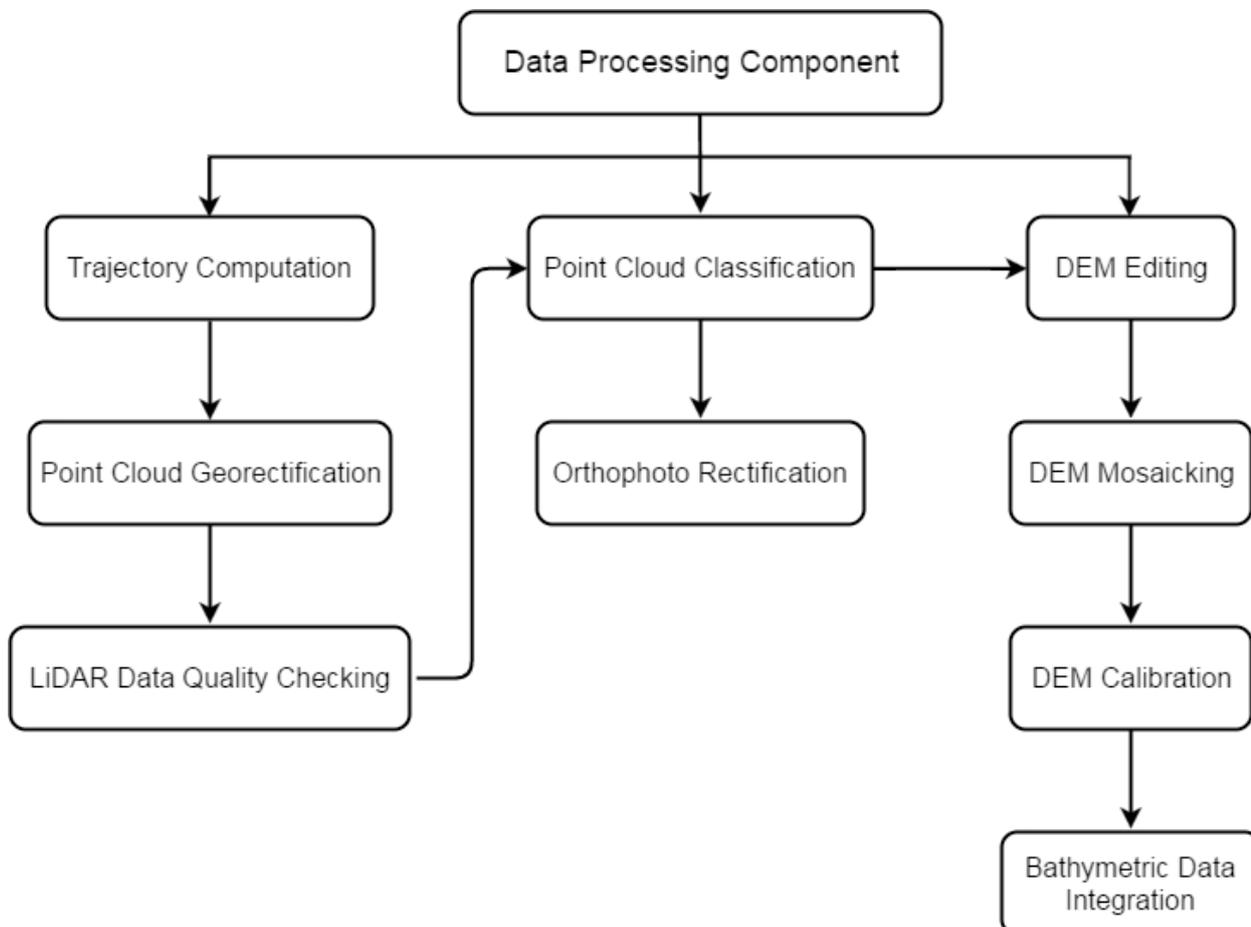

Figure 6. Schematic Diagram for Data Pre-Processing Component

3.2 Transmittal of Acquired LiDAR Data

The Data transfer sheets for all the LiDAR missions for Tangatan Floodplain can be found in Annex 5. Missions flown during the survey conducted on April 2016 used the Airborne LiDAR Terrain Mapper (ALTM™ Optech Inc.) Gemini System in Sta. Ana, Cagayan. The Data Acquisition Component (DAC) transferred a total of 62.85 Gigabytes of Range data, 0.89 Gigabytes of POS data, 48.33 Megabytes of GPS base station data, and 0 Gigabytes of raw image data to the data server on June 21, 2016. The Data Pre-processing Component (DPPC) verified the completeness of the transferred data. The whole dataset for Tangatan was fully transferred on June 21, 2016, as indicated on the Data Transfer Sheets for Tangatan Floodplain.

3.3 Trajectory Computation

The Smoothed Performance Metrics of the computed trajectory for flight 3971G, one of the Tangatan flights, which is the North, East, and Down position RMSE values are shown in Figure 7. The x-axis corresponds to the time of flight, which is measured by the number of seconds from the midnight of the start of the GPS week, which on that week fell on April 28, 2016 00:00AM. The y-axis is the RMSE value for that particular position.

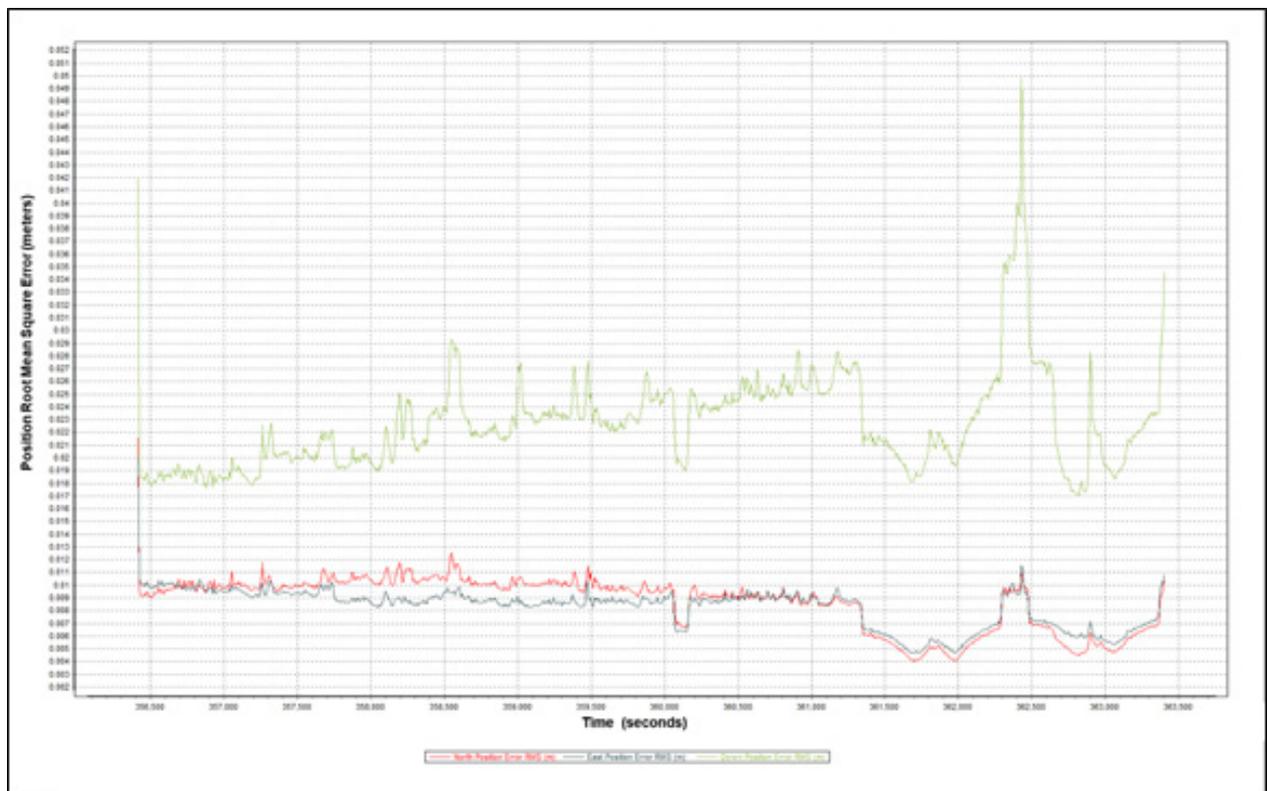

Figure 7. Smoothed Performance Metrics of Tangatan Flight 3971G

The time of flight was from 356,500 seconds to 363,500 seconds, which corresponds to morning of April 28, 2016. The initial spike seen in the data corresponds to the time when the aircraft was getting into position to start the acquisition, and when the POS system started computing for the position and orientation of the aircraft. Redundant measurements from the POS system quickly minimized the RMSE value of the positions. The periodic increase in RMSE values from an otherwise smoothly curving RMSE values correspond to the turn-around period of the aircraft, when the aircraft makes a turn to start a new flight line. Figure 7 shows that the North position RMSE peaks at 1.25 centimeters, the East position RMSE peaks at 1.15 centimeters, and the Down position RMSE peaks at 5.00 centimeters, which are within the prescribed accuracies described in the methodology.

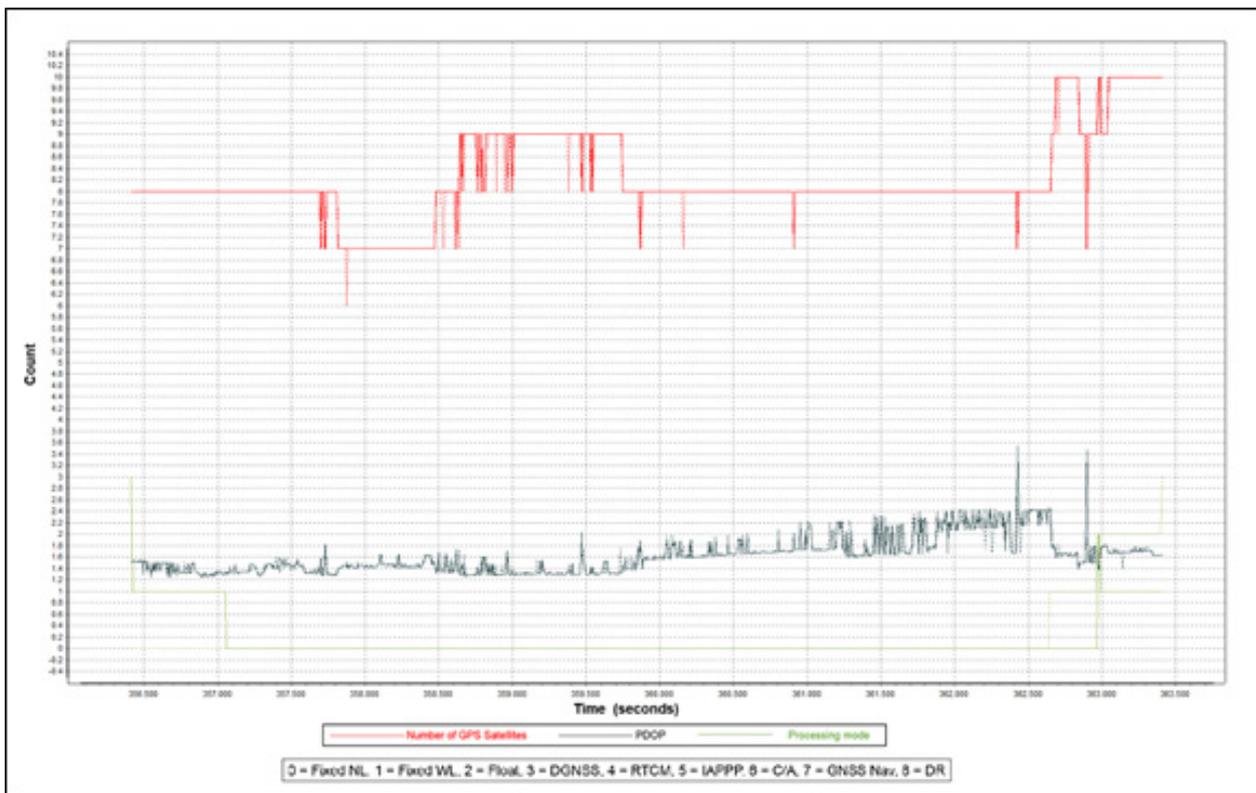

Figure 8. Solution Status Parameters of Tangatan Flight 3971G

The Solution Status parameters of flight 3971G, one of the Tangatan flights, which are the number of GPS satellites, Positional Dilution of Precision (PDOP), and the GPS processing mode used, are shown in Figure 8. The graphs indicate that the number of satellites during the acquisition did not go below 6. Majority of the time, the number of satellites tracked was between 6 and 10. The PDOP value also did not go above the value of 3.6, which indicates optimal GPS geometry. The processing mode stayed at the value of 0 for majority of the survey. The value of 0 corresponds to a Fixed, Narrow-Lane mode, which is the optimum carrier-cycle integer ambiguity resolution technique available for POSPAC MMS. All of the parameters adhered to the accuracy requirements for optimal trajectory solutions, as indicated in the methodology.

The computed best estimated trajectory for all Tangatan flights is shown in Figure 9.

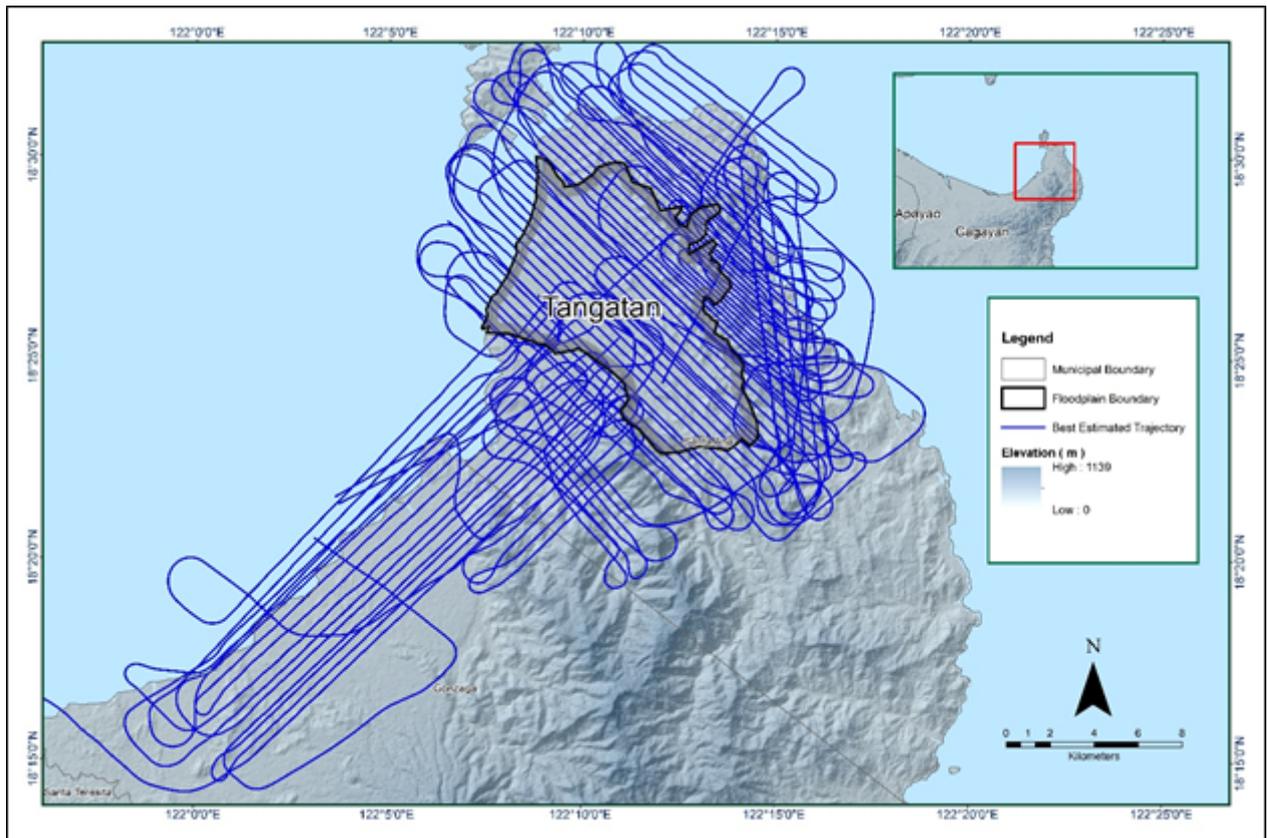

Figure 9. Best Estimated Trajectory for Tangatan Floodplain

3.4 LiDAR Point Cloud Computation

The produced LAS data contain 71 flight lines, with each flight line containing one channel, since the Gemini System contains only one channel. The summary of the self-calibration results obtained from LiDAR processing in LiDAR Mapping Suite (LMS) software for all flights over Tangatan Floodplain are given in Table 8.

Table 8. Self-Calibration Results values for Tangatan flights.

Parameter	Acceptable Value	Value
Boresight Correction stdev)	<0.001degrees	0.000876
IMU Attitude Correction Roll and Pitch Correction stdev)	<0.001degrees	0.000809
GPS Position Z-correction stdev)	<0.01meters	0.0024

The optimum accuracy is obtained for all Tangatan flights based on the computed standard deviations of the corrections of the orientation parameters. Standard deviation values for individual blocks are available in the Annex 8. Mission Summary Reports.

3.5 LiDAR Data Quality Checking

The boundary of the processed LiDAR data on top of a SAR Elevation Data over Tangatan Floodplain is shown in Figure 10. The map shows gaps in the LiDAR coverage that are attributed to cloud coverage.

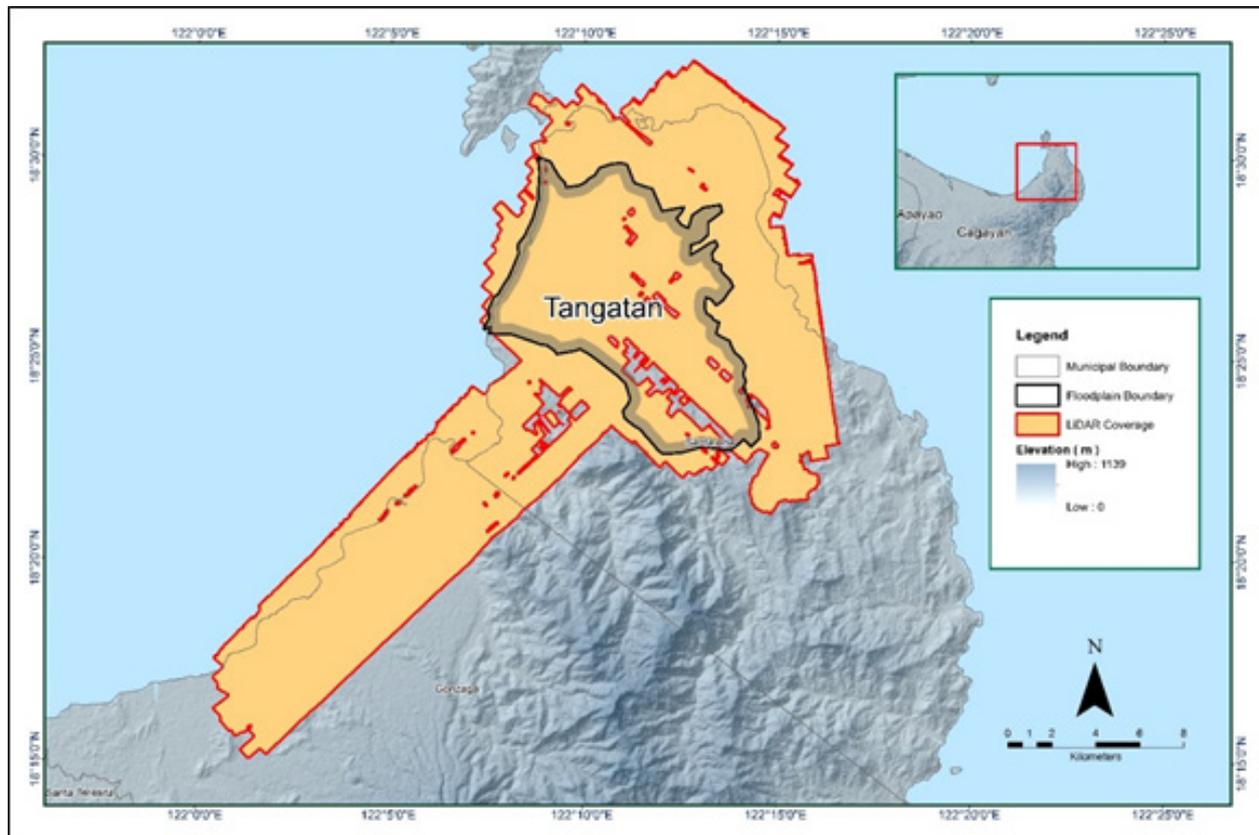

Figure 10. Boundary of the processed LiDAR data over Tangatan Floodplain

The total area covered by the Tangatan missions is 319.39 sq.km that is comprised of four (4) flight acquisitions grouped and merged into four (4) blocks as shown in Table 9.

Table 9. List of LiDAR blocks for Tangatan Floodplain

LiDAR Blocks	Flight Numbers	Area (sq. km)
Cagayan_reflights_Bl3D	4001G	25.86
Cagayan_reflights_Bl3E	4001G	31.41
Cagayan_reflights_Bl3A	3971G	107.76
	3991G	
	4001G	
Cagayan_reflights_Bl3C	3971G	154.36
	3989G	
	3991G	
TOTAL		319.39 sq. km.

The overlap data for the merged LiDAR blocks, showing the number of channels that pass through a particular location is shown in Figure 11. Since the Gemini System employs one channel, we would expect an average value of 1 (blue) for areas where there is limited overlap, and a value of 2 (yellow) or more (red) for areas with three or more overlapping flight lines.

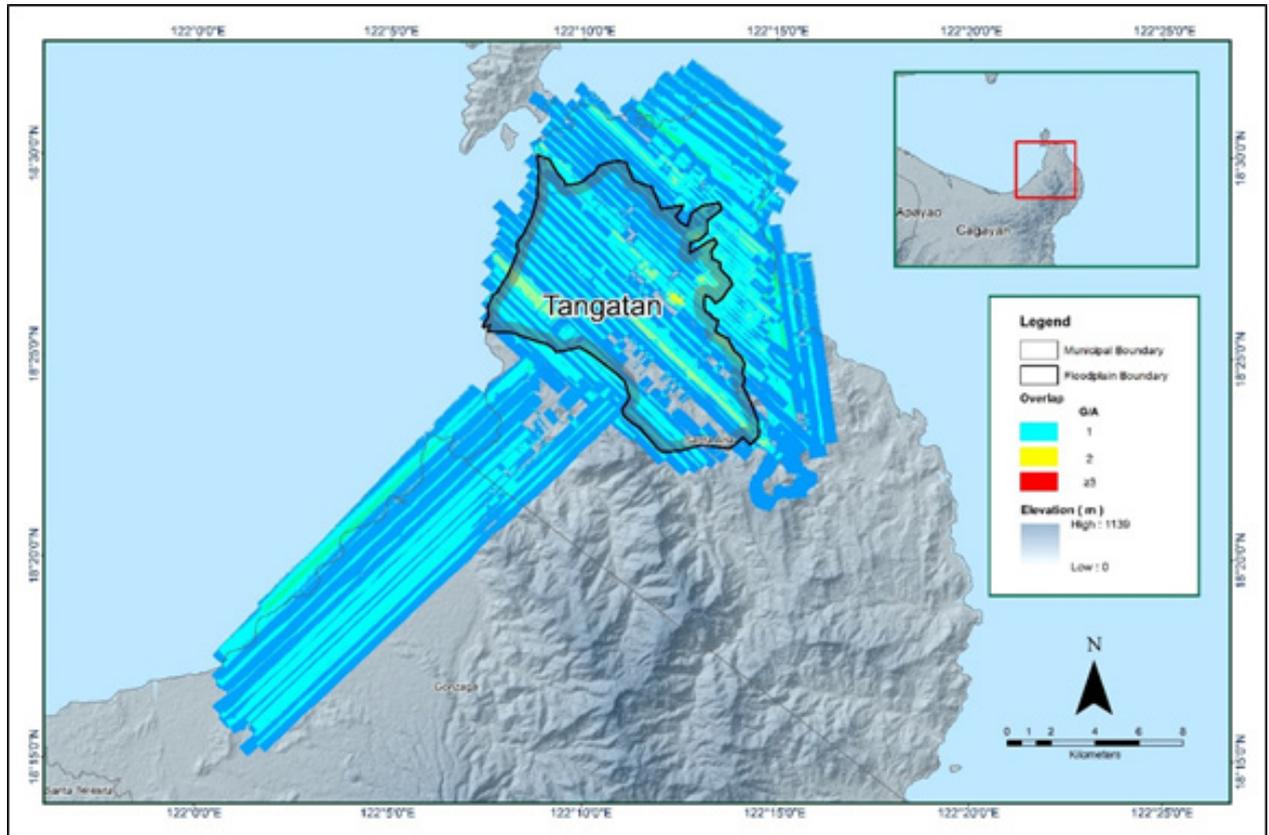

Figure 11. Image of data overlap for Tangatan Floodplain

The overlap statistics per block for the Tangatan Floodplain can be found in Annex 8. One pixel corresponds to 25.0 square meters on the ground. For this area, the minimum and maximum percent overlaps are 39.43% and 44.96% respectively, which passed the 25% requirement.

The pulse density map for the merged LiDAR data, with the red parts showing the portions of the data that satisfy the 2 points per square meter criterion is shown in Figure 12. It was determined that all LiDAR data for Tangatan Floodplain satisfy the point density requirement, and the average density for the entire survey area is 4.17 points per square meter.

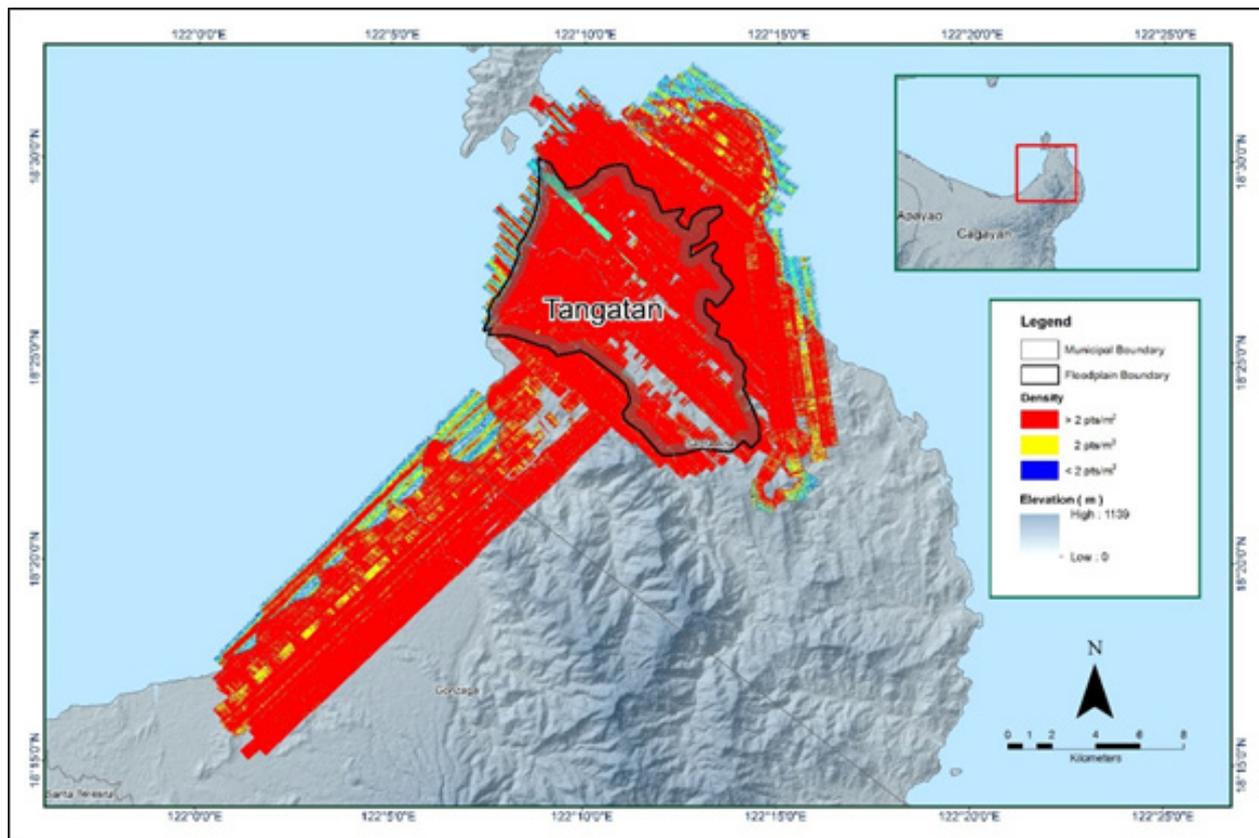

Figure 12. Pulse density map of merged LiDAR data for Tangatan Floodplain

The elevation difference between overlaps of adjacent flight lines is shown in Figure 13. The default color range is from blue to red, where bright blue areas correspond to portions where elevations of a previous flight line, identified by its acquisition time, are higher by more than 0.20m relative to elevations of its adjacent flight line. Bright red areas indicate portions where elevations of a previous flight line are lower by more than 0.20m relative to elevations of its adjacent flight line. Areas with bright red or bright blue need to be investigated further using Quick Terrain Modeler software.

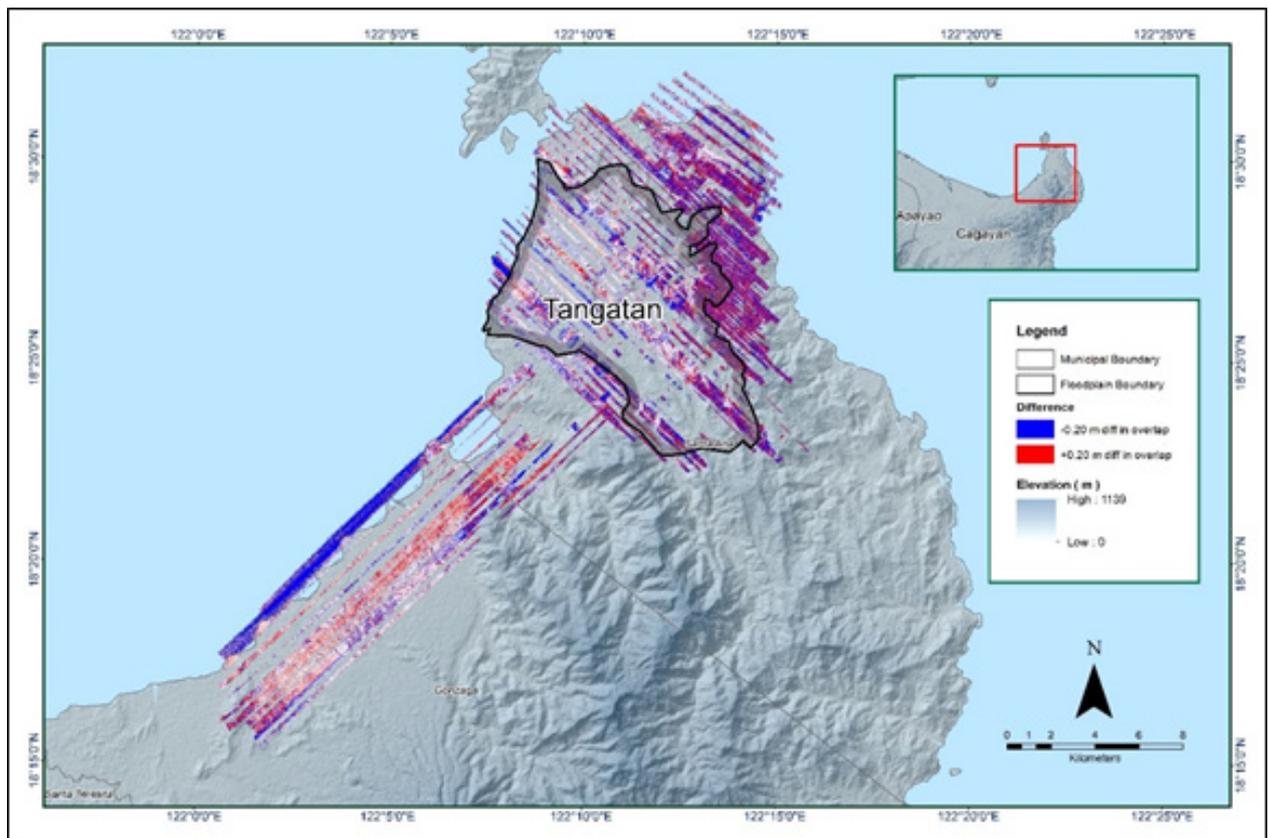

Figure 13. Elevation difference map between flight lines for Tangatan Floodplain

A screen capture of the processed LAS data from Tangatan flight 3971G loaded in QT Modeler is shown in Figure 14. The upper left image shows the elevations of the points from two overlapping flight strips traversed by the profile, illustrated by a dashed yellow line. The x-axis corresponds to the length of the profile. It is evident that there are differences in elevation, but the differences do not exceed the 20-centimeter mark. This profiling was repeated until the quality of the LiDAR data becomes satisfactory. No reprocessing was done for this LiDAR dataset.

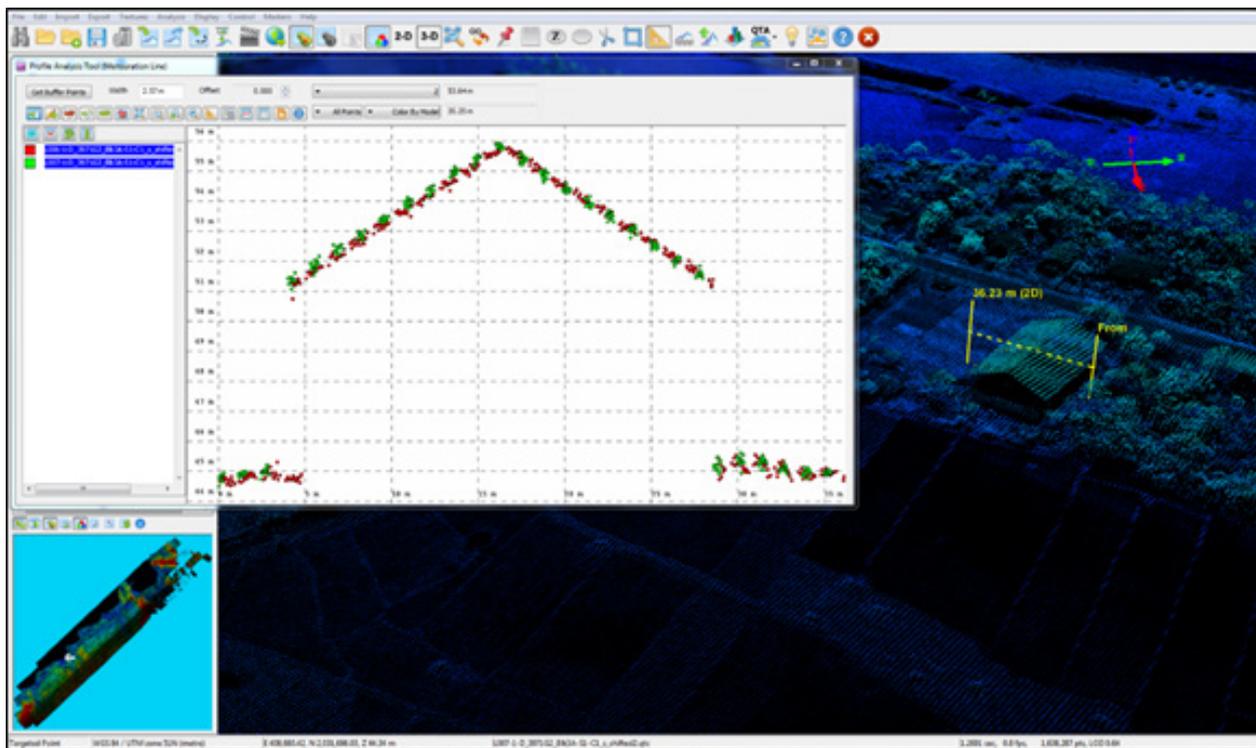

Figure 14. Quality checking for Tangatan flight 1436A using the Profile Tool of QT Modeler

3.6 LiDAR Point Cloud Classification and Rasterization

Table 10. Tangatan classification results in TerraScan.

Pertinent Class	Total Number of Points
Ground	152,013,355
Low Vegetation	147,703,840
Medium Vegetation	410,163,866
High Vegetation	778,394,471
Building	13,610,705

The tile system that TerraScan employed for the LiDAR data and the final classification image for a block in Tangatan floodplain is shown in Figure 15. A total of 471 1km by 1km tiles were produced. The number of points classified to the pertinent categories is illustrated in Table 10. The point cloud has a maximum and minimum height of 1,137.78 meters and 36.47 meters respectively.

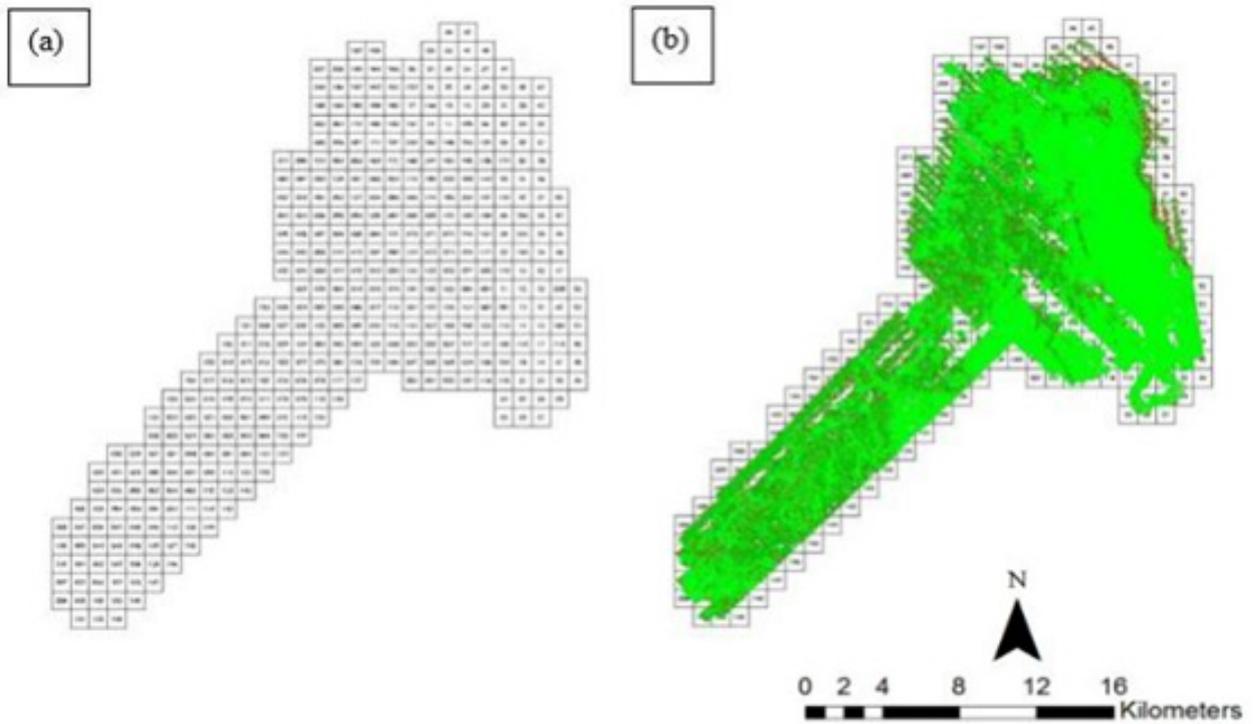

Figure 15. Tiles for Tangatan Floodplain (a) and classification results (b) in TerraScan

An isometric view of an area before and after running the classification routines is shown in Figure 16. The ground points are in orange, the vegetation is in different shades of green, and the buildings are in cyan. It can be seen that residential structures adjacent or even below canopy are classified correctly, due to the density of the LiDAR data.

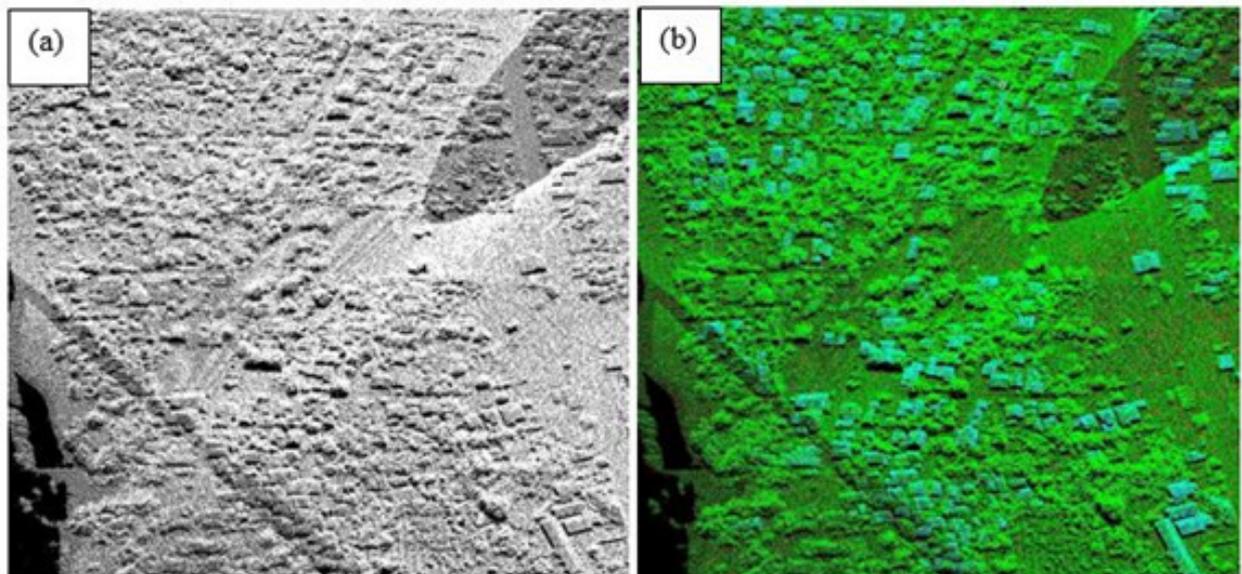

Figure 16. Point cloud before (a) and after (b) classification.

The production of last return (V_ASCII) and the secondary (T_ASCII) DTM, first (S_ASCII) and last (D_ASCII) return DSM of the area in top view display are shown in Figure 17. It shows that DTMs are the representation of the bare earth while on the DSMs, all features are present such as buildings and vegetation.

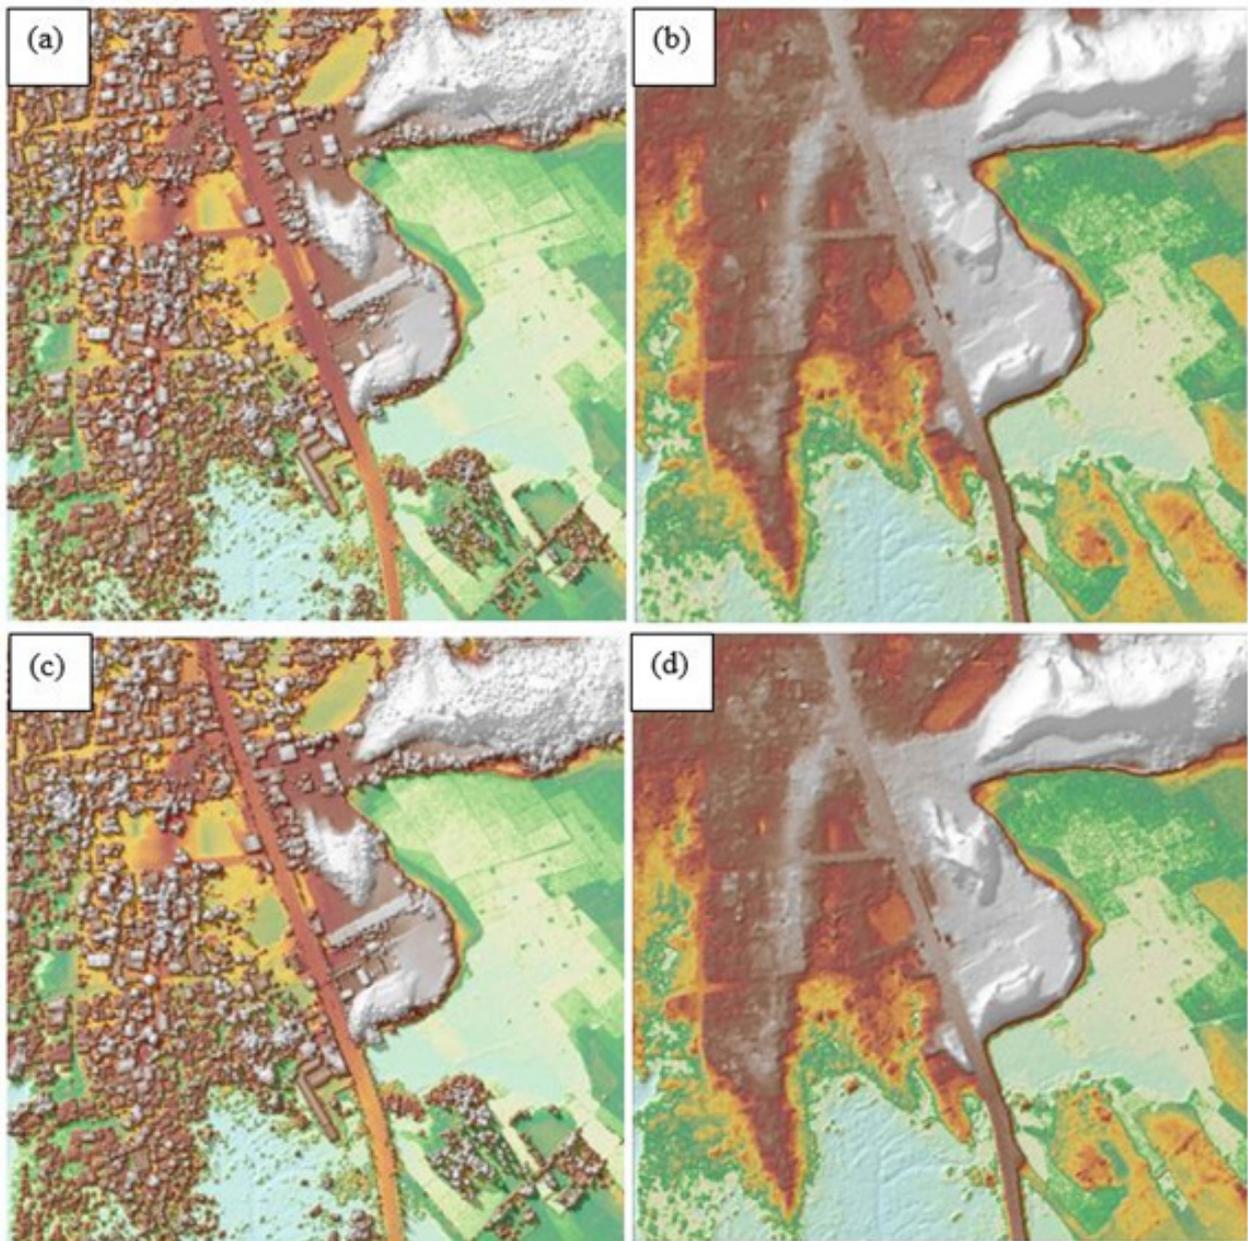

Figure 17. The production of last return DSM (a) and DTM (b), first return DSM (c) and secondary DTM (d) in some portion of Tangatan Floodplain

3.7 LiDAR Image Processing and Orthophotograph Rectification

There are no orthophotographs available for the Tangatan Floodplain.

3.8 DEM Editing and Hydro-Correction

Four (4) mission blocks were processed for Tangatan Floodplain. These blocks are composed of Cagayan_reflights blocks with a total area of 320.80 square kilometers. Table 11 shows the name and corresponding area of each block in square kilometers.

Table 11. LiDAR blocks with its corresponding area

LiDAR Blocks	Area (sq.km)
Cagayan_reflights_Bl3A	107.76
Cagayan_reflights_Bl3C	154.36
Cagayan_reflights_Bl3D	25.86
Cagayan_reflights_Bl3E	31.41
TOTAL	319.39 sq.km

Portions of DTM before and after manual editing are shown in Figure 18. A road (Figure 18a) has been misclassified and removed during classification process and has to be interpolated to complete the surface (Figure 18b) to allow the correct flow of water. An interpolated irrigation (Figure 18c) was retrieved (Figure 18d) in order to hydrologically correct the irrigation system. Another example is an interpolated ridge (Figure 18e) has to be retrieved using object retrieval to achieve the actual surface (Figure 18f). Another example is a building that is still present in the DTM after classification (Figure 18g) and has to be removed through manual editing (Figure 18h).

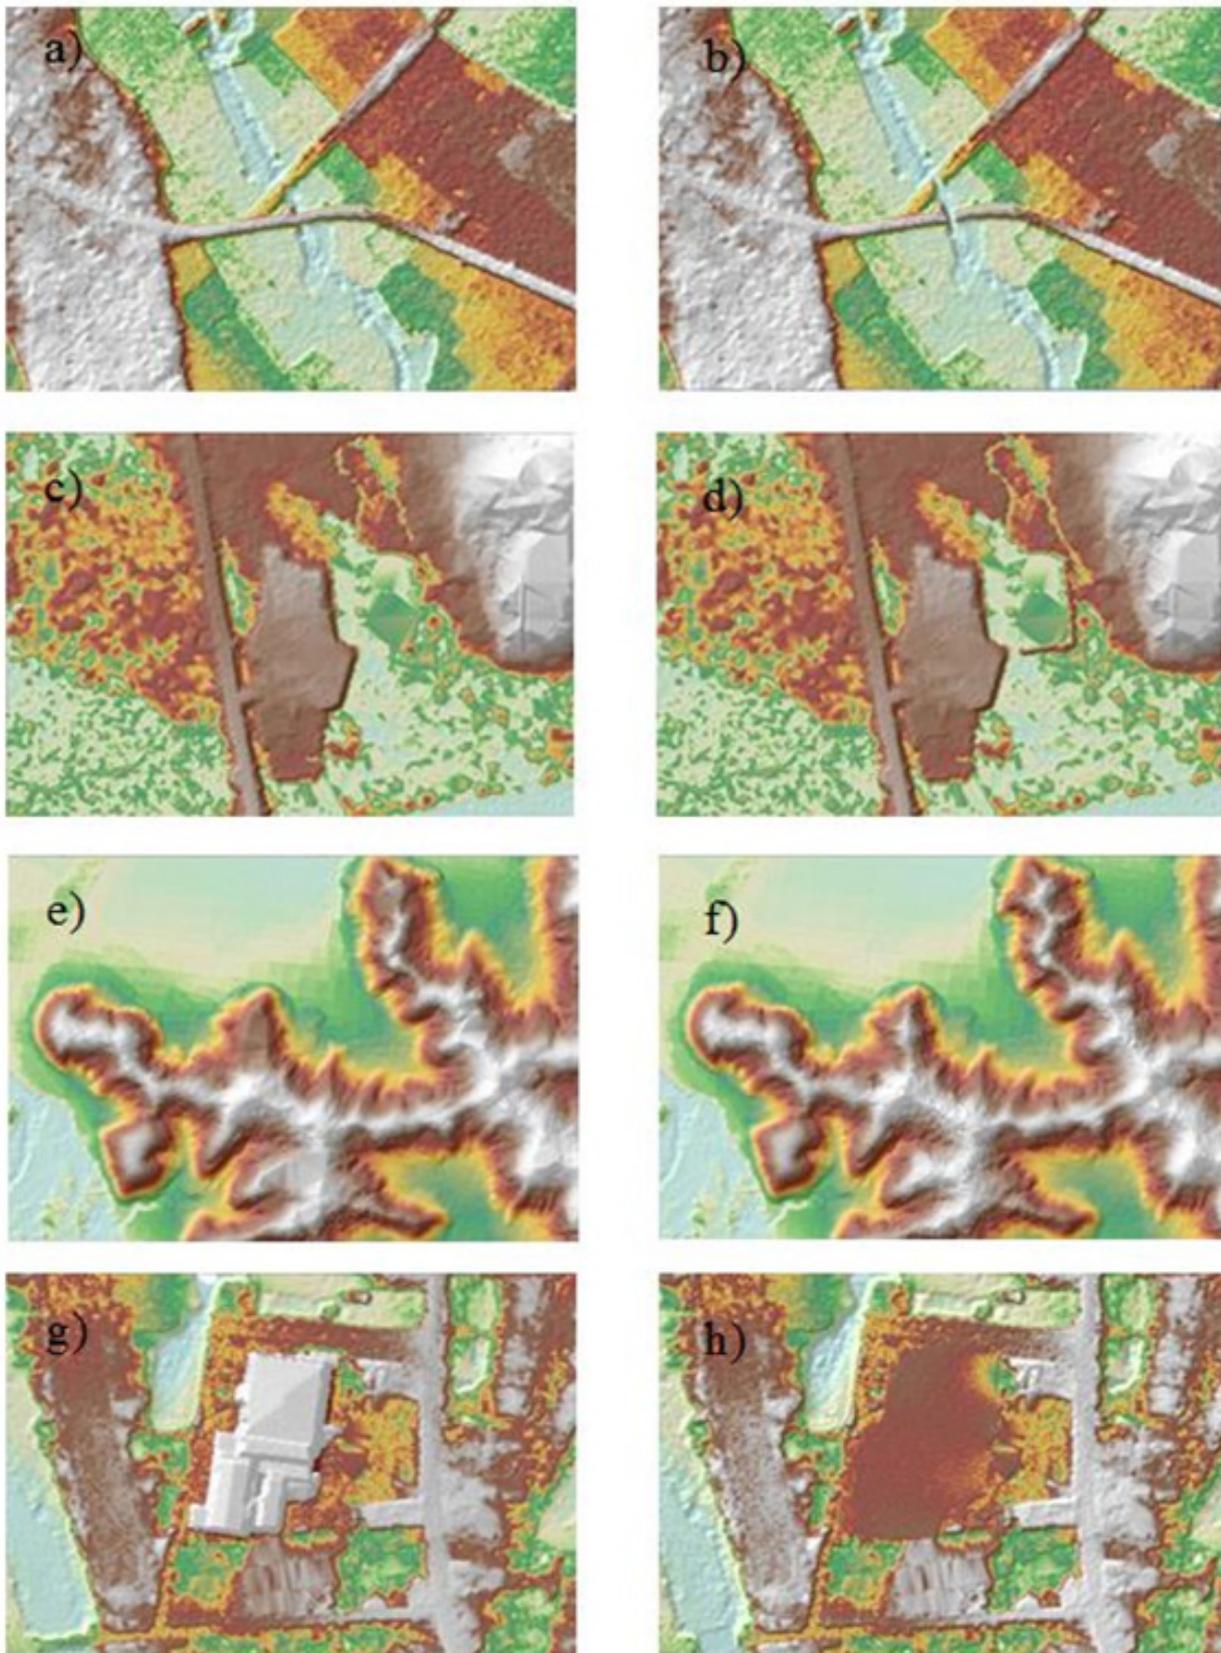

Figure 18. Portions in the DTM of Tangatan Floodplain – a bridge before (a) and after (b) manual editing; an irrigation before (c) and after (d); interpolated ridge before (e) and after (f) object retrieval; and a building before (g) and after (h) manual editing.

3.9 Mosaicking of Blocks

No assumed reference block was used in mosaicking because the identified reference for shifting was an existing Aunugay DEM which was calibrated using Cagayan DEM overlapping with the blocks to be mosaicked. Table 12 shows the shift values applied to each LiDAR block during mosaicking.

Mosaicked LiDAR DTM for Tangatan Floodplain is shown in Figure 19. The entire Tangatan Floodplain is 91.30% covered by LiDAR data while portions with no LiDAR data were patched with the available IFSAR data.

Table 12. Shift Values of each LiDAR Block of Tangatan Floodplain

Mission Blocks	Shift Values (meters)		
	x	y	z
Cagayan_reflights_Bl3A	6.32	1.18	-4.72
Cagayan_reflights_Bl3C	5.99	2.06	-4.51
Cagayan_reflights_Bl3D	6.36	1.84	-3.32
Cagayan_reflights_Bl3E	5.48	0.95	-5.01

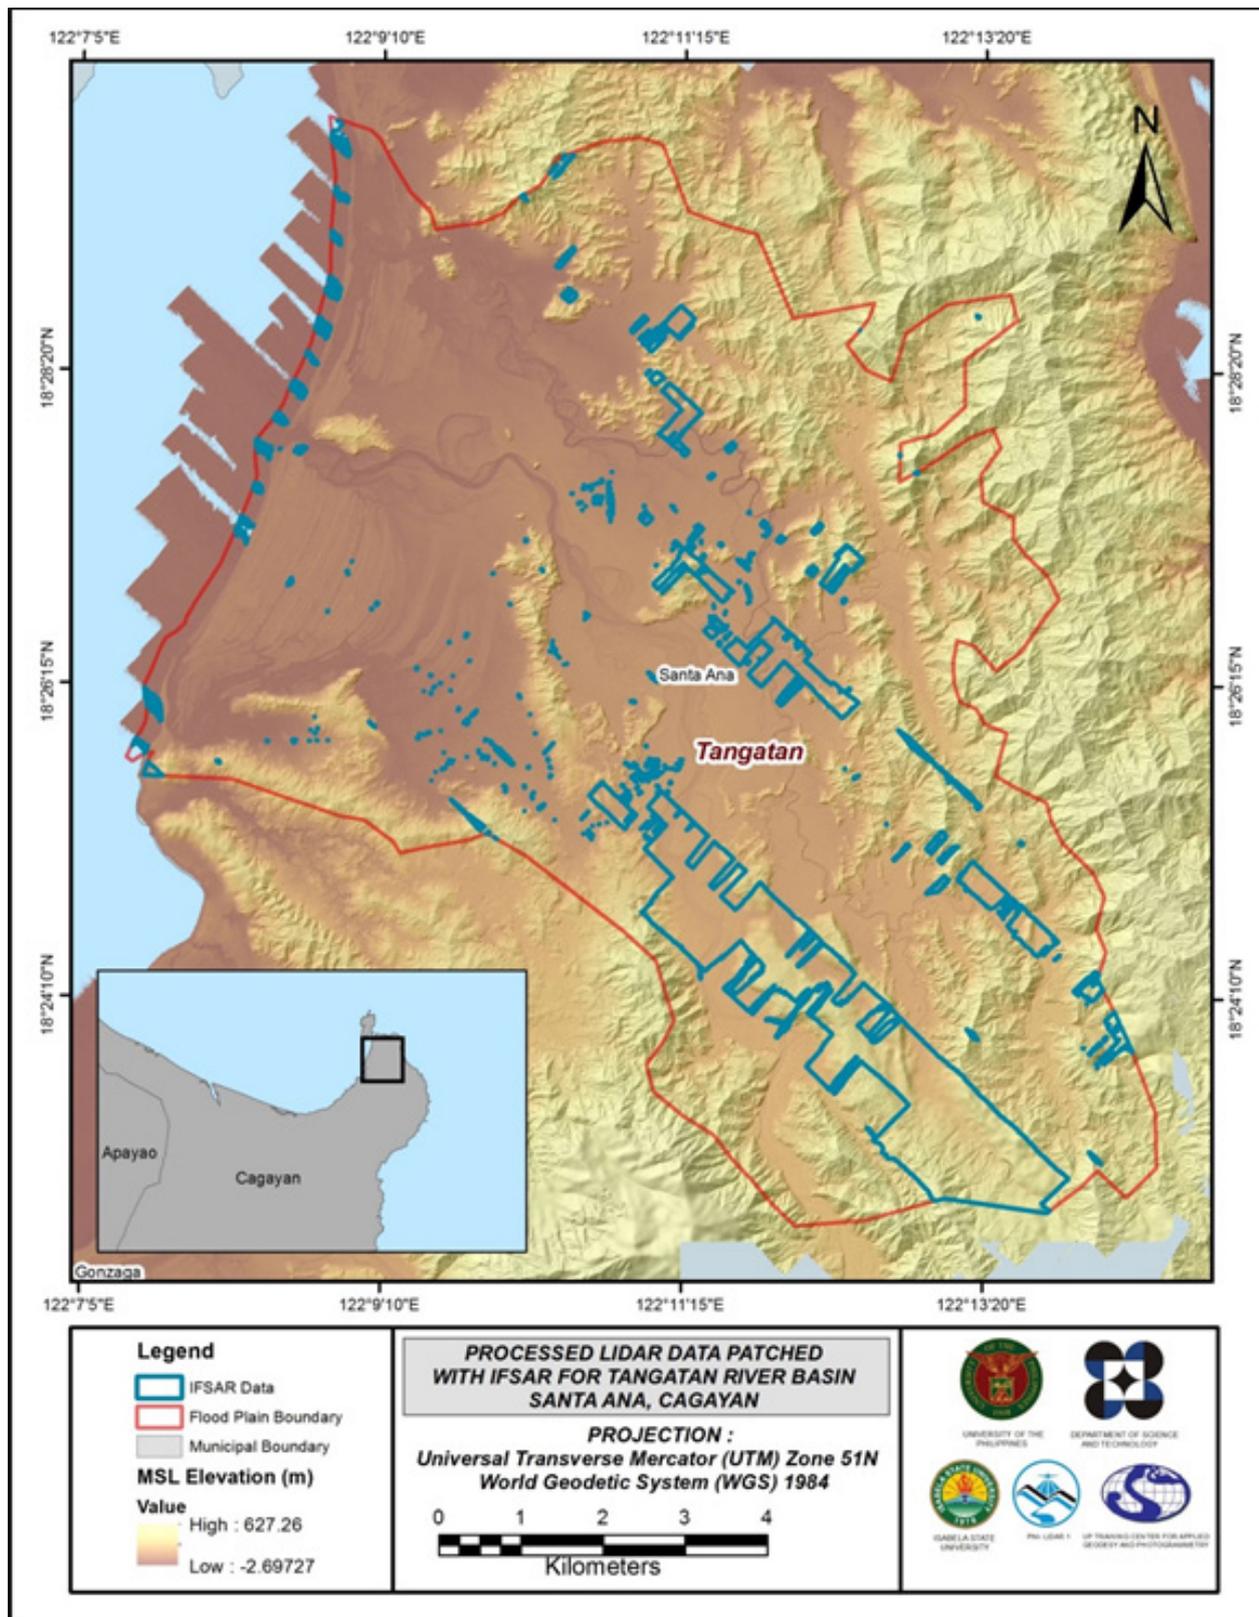

Figure 19. Map of Processed LiDAR Data for Tangatan Floodplain

3.10 Calibration and Validation of Mosaicked LiDAR DEM

The extent of the validation survey done by the Data Validation and Bathymetry Component (DVBC) in Cagayan to collect points with which the LiDAR dataset was validated is shown in Figure 20. A total of 6,209 survey points were gathered for all the floodplains within Cagayan wherein the Tangatan is located. However, the point dataset was not used for the calibration of the LiDAR data for Tangatan because during the mosaicking process, each LiDAR block was referred to the calibrated Cagayan DEM. Therefore, the mosaicked DEM of Tangatan can already be considered as a calibrated DEM.

A good correlation between the uncalibrated Cagayan LiDAR DTM and ground survey elevation values is shown in Figure 21. Statistical values were computed from extracted LiDAR values using the selected points to assess the quality of data and obtain the value for vertical adjustment. The computed height difference between the LiDAR DTM and calibration points is 0.14 meters with a standard deviation of 0.13 meters. Calibration of Cagayan LiDAR data was done by subtracting the height difference value, 0.14 meters, to Cagayan mosaicked LiDAR data. Table 13 shows the statistical values of the compared elevation values between Cagayan LiDAR data and calibration data. These values were also applicable to the Tangatan DEM.

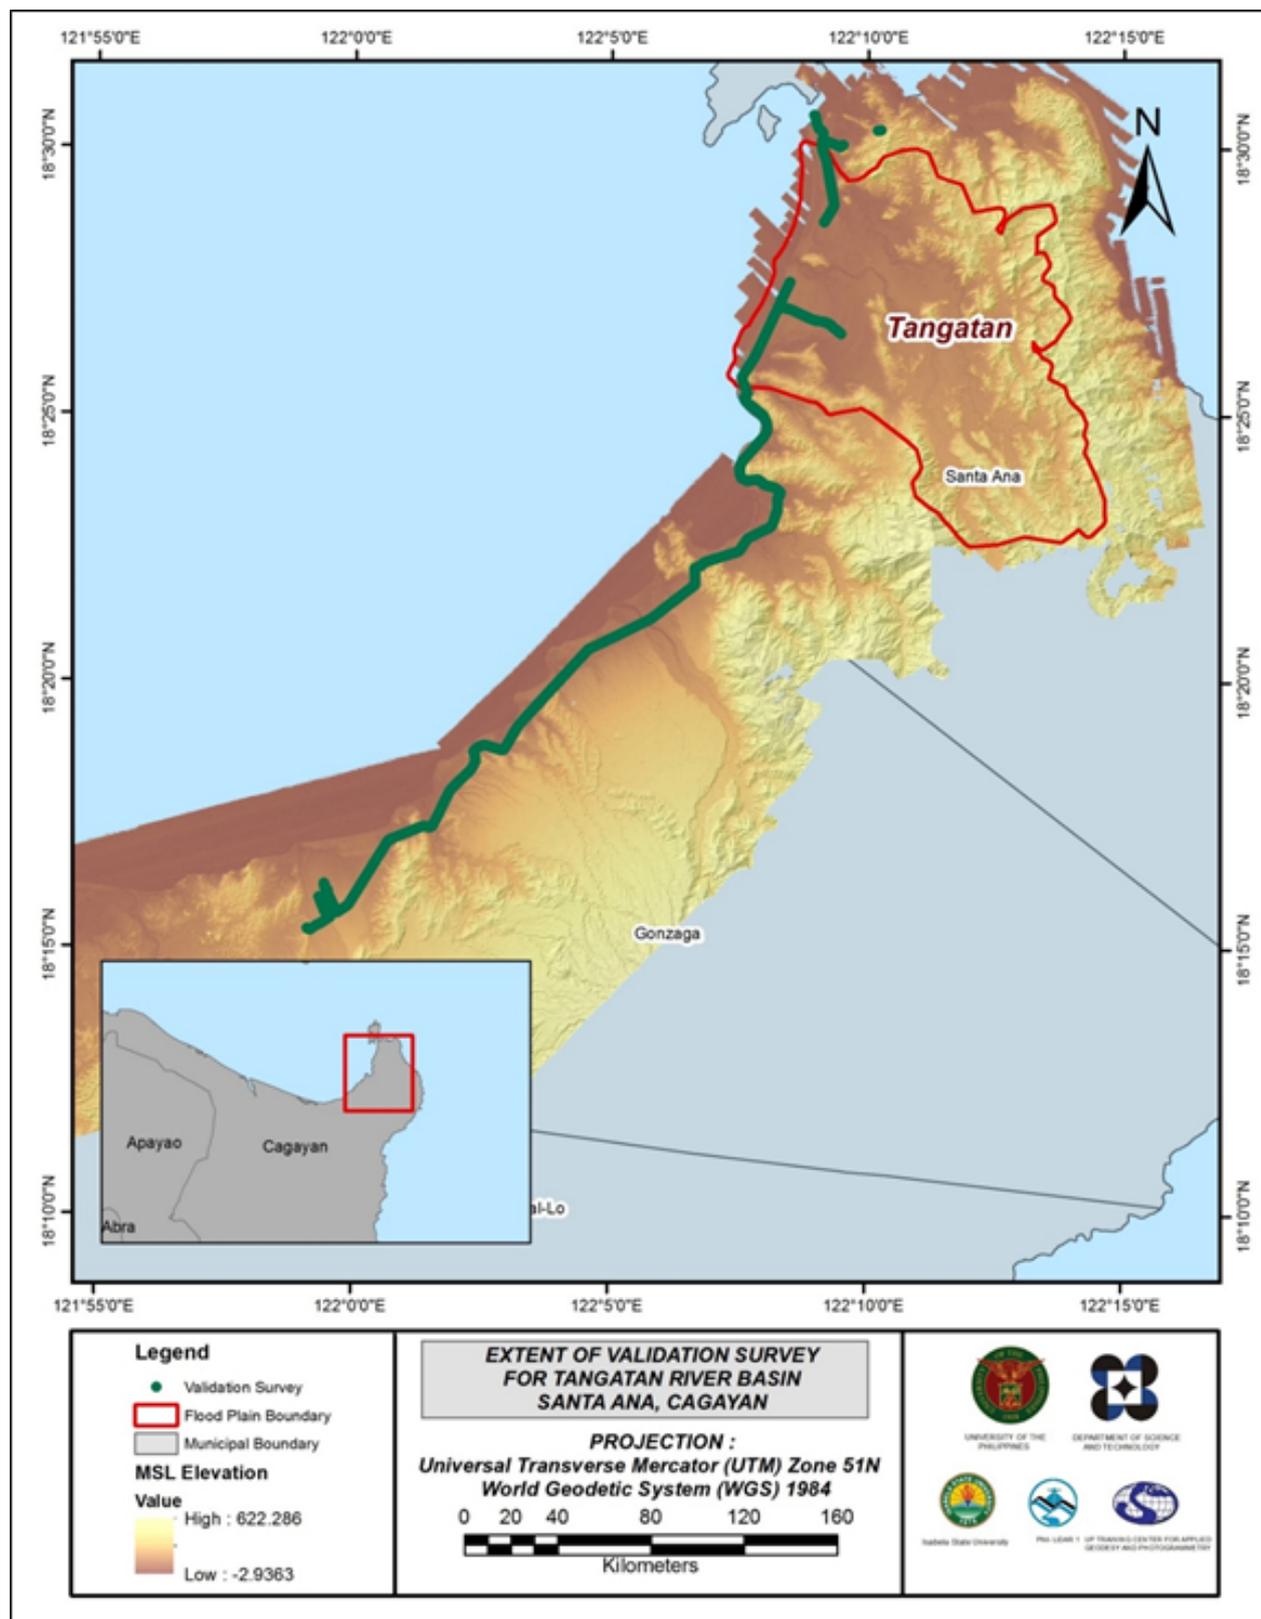

Figure 20. Map of Tangatan Floodplain with validation survey points in green

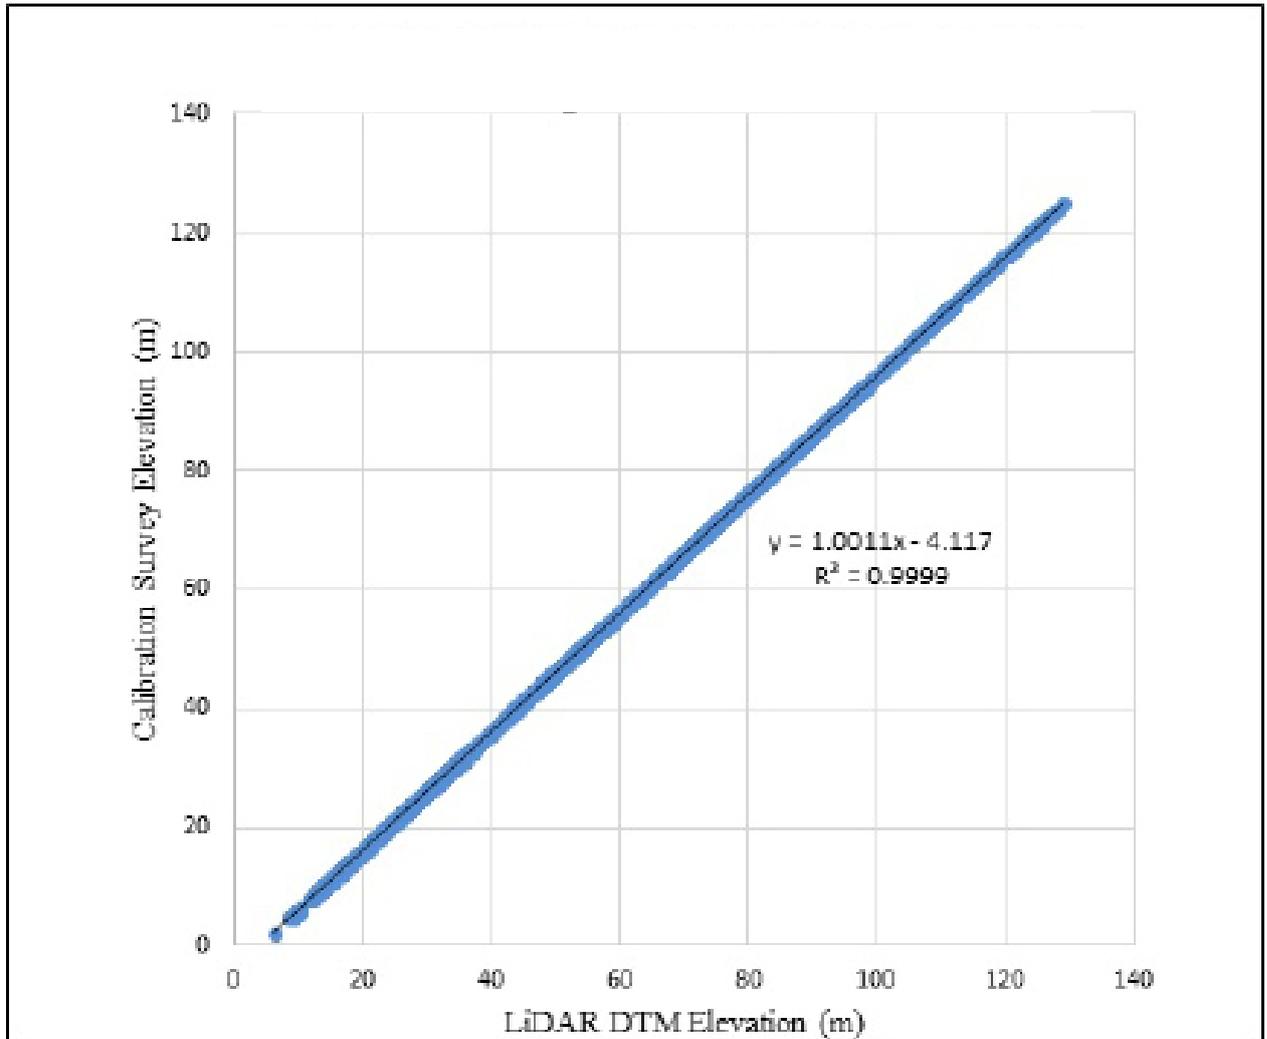

Figure 21. Correlation plot between calibration survey points and LiDAR data

Table 13. Calibration Statistical Measures

Calibration Statistical Measures	Value (meters)
Height Difference	0.14
Standard Deviation	0.13
Average	-0.05
Minimum	-0.32
Maximum	0.22

A total of 1,074 survey points that lie within Tangatan Floodplain and were used for the validation of the calibrated Tangatan DTM. A good correlation between the calibrated mosaicked LiDAR elevation values and the ground survey elevation, which reflects the quality of the LiDAR DTM is shown in Figure 22. The computed RMSE between the calibrated LiDAR DTM and validation elevation values is 0.17 meters with a standard deviation of 0.07 meters, as shown in Table 14.

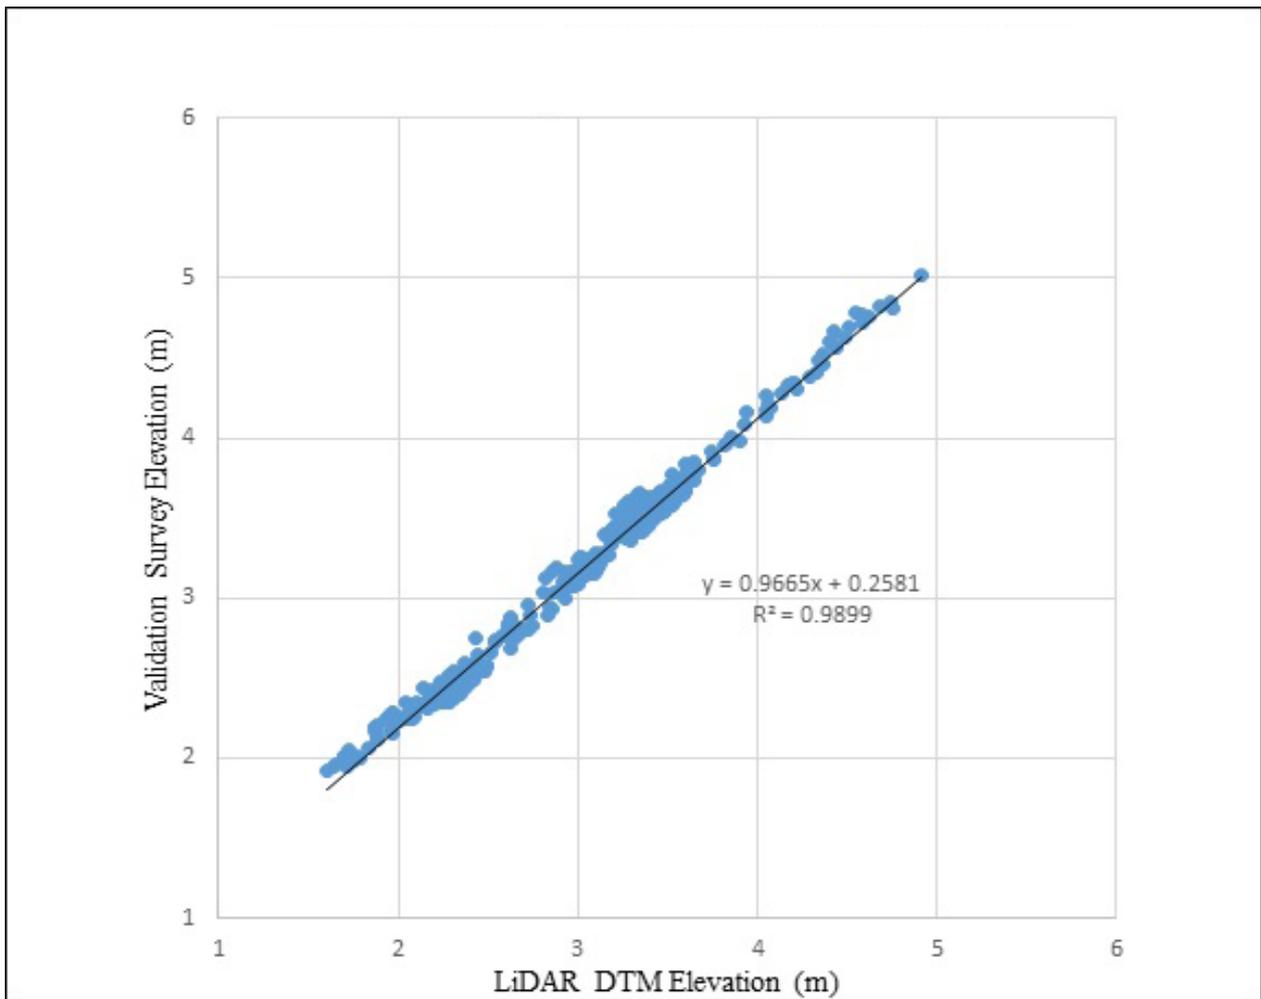

Figure 22. Correlation plot between validation survey points and LiDAR data

Table 14. Validation Statistical Measures

Validation Statistical Measures	Value (meters)
RMSE	0.17
Standard Deviation	0.07
Average	0.16
Minimum	0.06
Maximum	0.32

3.11 Integration of Bathymetric Data into the LiDAR Digital Terrain Model

For bathy integration, centerline and zigzag were available for Tangatan with 4,036 bathymetric survey points. The resulting raster surface produced was done by Inverse Distance Weighted (IDW) interpolation method. After burning the bathymetric data to the calibrated DTM, assessment of the interpolated surface is represented by the computed RMSE value of 0.27 meters. The extent of the bathymetric survey done by the Data Validation and Bathymetry Component (DVBC) in Tangatan integrated with the processed LiDAR DEM is shown in Figure 23.

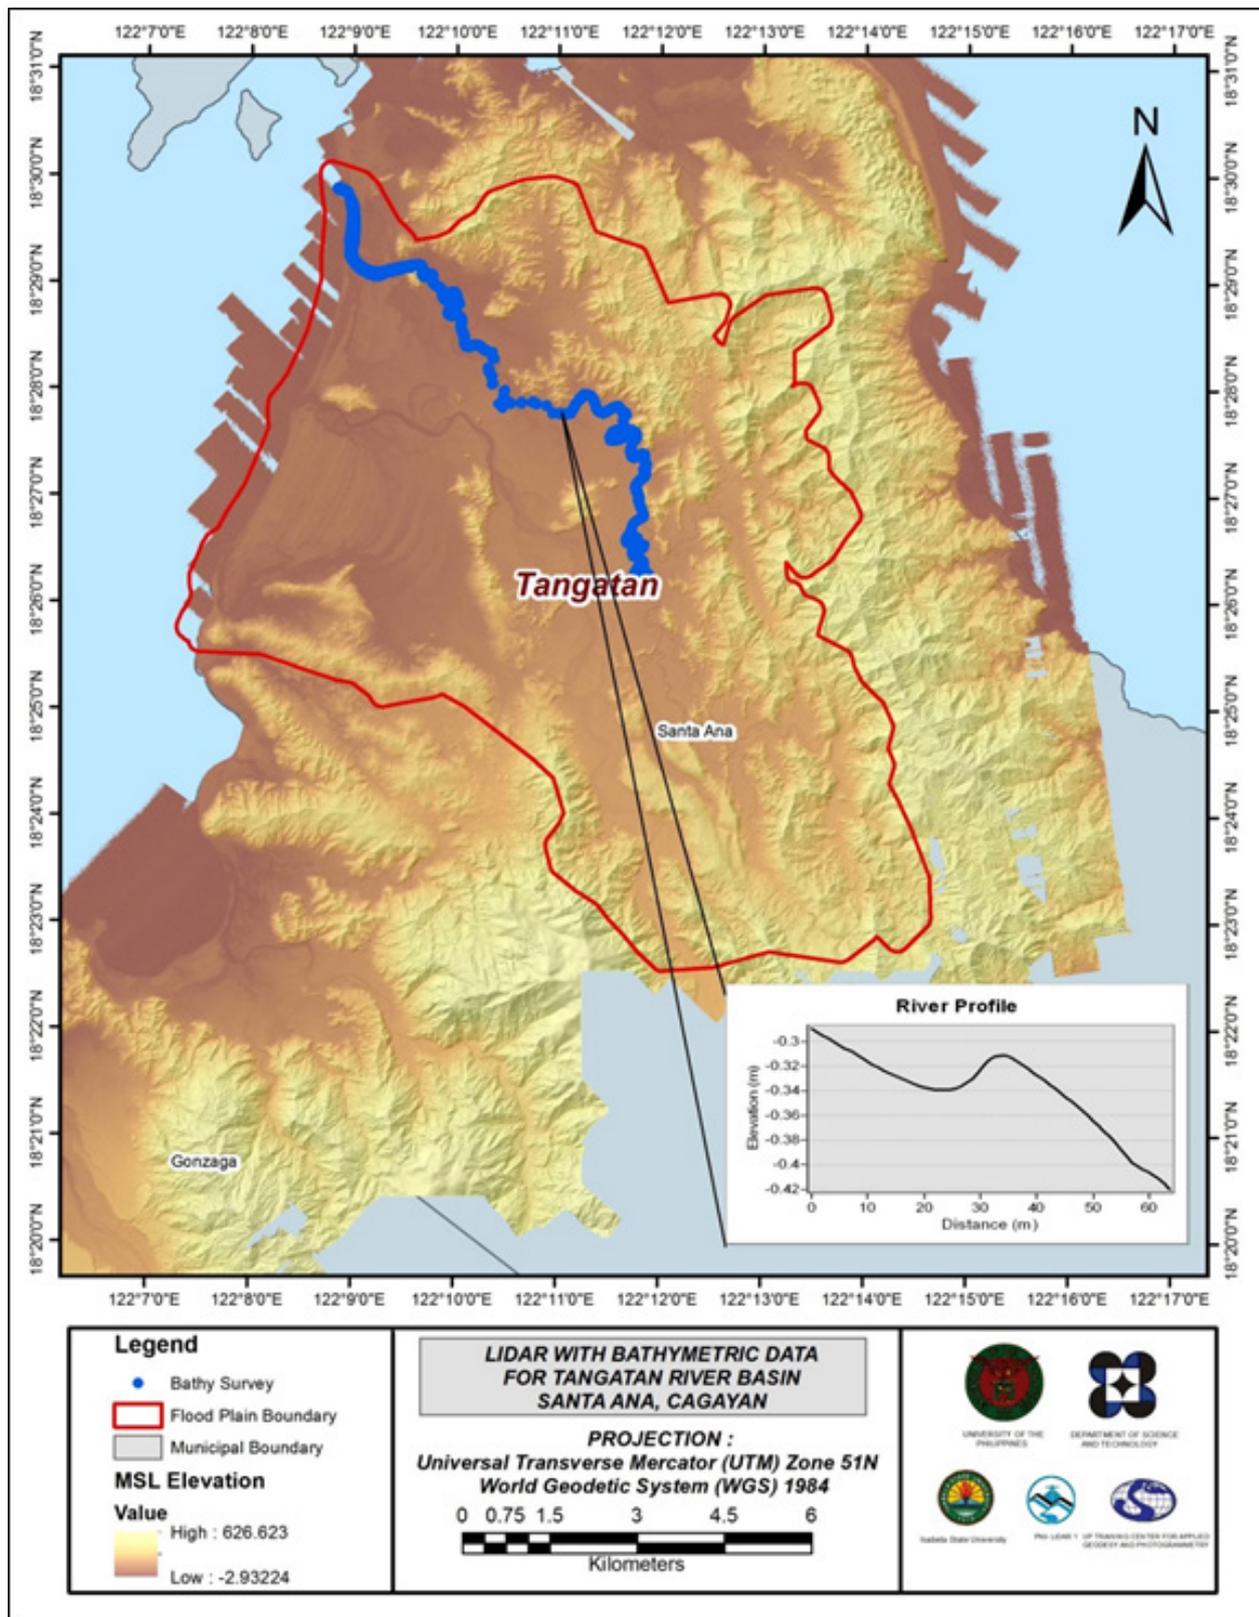

Figure 23. Map of Tangatan Floodplain with bathymetric survey points shown in blue

3.12 Feature Extraction

The features salient in flood hazard exposure analysis include buildings, road networks, bridges and water bodies within the floodplain area with 200 m buffer zone. Mosaicked LiDAR DEM with 1 m resolution was used to delineate footprints of building features, which consist of residential buildings, government offices, medical facilities, religious institutions, and commercial establishments, among others. Road networks comprise of main thoroughfares such as highways and municipal and barangay roads essential for routing of disaster response efforts. These features are represented by a network of road centerlines.

3.12.1 Quality Checking of Digitized Features' Boundary

The Tangatan Floodplain, including its 200 m buffer, has a total area of 105.09 sq km. For this area, a total of 5.0 sq km, corresponding to a total of 603 building features, are considered for QC. Figure 24 shows the QC blocks for Tangatan Floodplain.

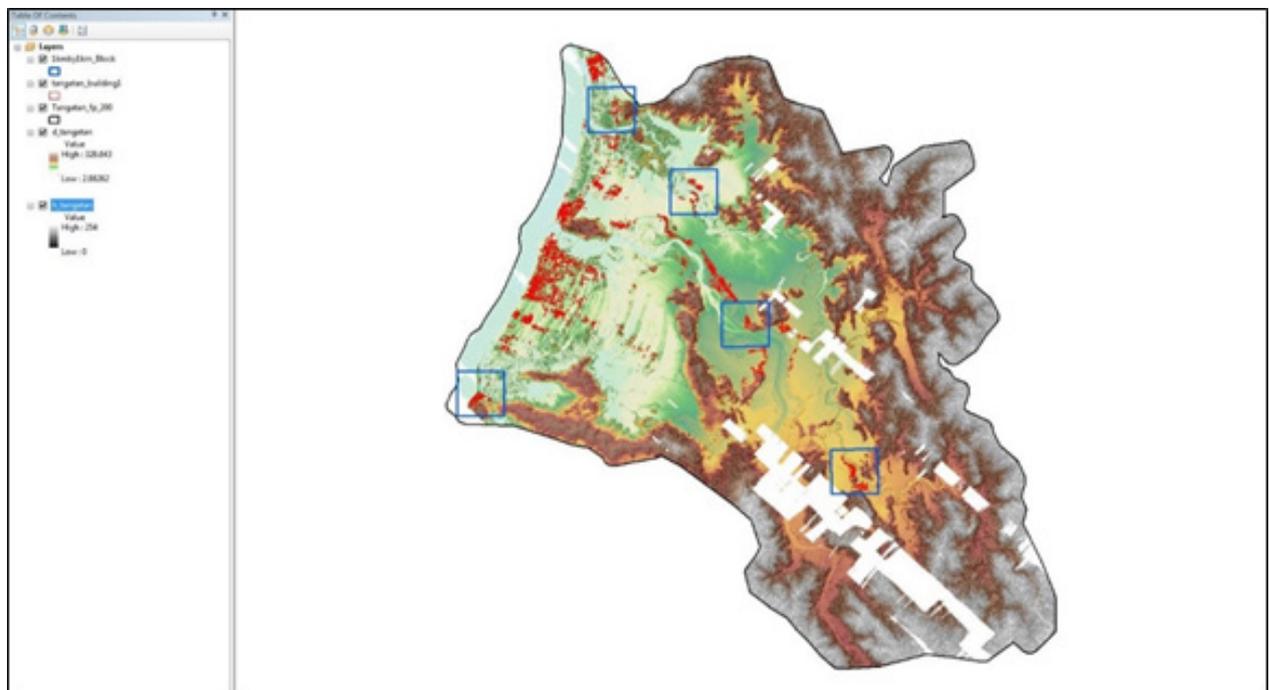

Figure 24. QC blocks for Tangatan building features

Quality checking of Tangatan building features resulted in the ratings shown in Table 16.

Table 15. Quality Checking Ratings for Tangatan Building Features

FLOODPLAIN	COMPLETENESS	CORRECTNESS	QUALITY	REMARKS
Tangatan	97.56	99.34	89.55	PASSED

3.12.2 Height Extraction

Height extraction was done for 4,911 building features in Tangatan Floodplain. Of these building features, 252 was filtered out after height extraction, resulting to 4,659 buildings with height attributes. The lowest building height is at 2.00m, while the highest building is at 4.67 m.

3.12.3 Feature Attribution

The digitized features were identified using participatory mapping. Stakeholders (barangay officials) were invited in a forum and were given maps of their respective barangays. They attributed first non-residential buildings like barangay hall, schools, churches, commercial buildings, etc. then other building left were then coded as residential. An nDSM was generated using the LiDAR DEMs to extract the heights of the buildings. A minimum height of 2 meters was used to filter out the terrain features that were digitized as buildings. Buildings that were not yet constructed during the time of LiDAR acquisition were noted as new buildings in the attribute table.

Table 16 summarizes the number of building features per type. On the other hand, Table 17 shows the total length of each road type, while Table 18 shows the number of water features extracted per type.

Table 16. Building Features Extracted for Tangatan Floodplain

Facility Type	No. of Features
Residential	4,331
School	104
Market	19
Agricultural/Agro-Industrial Facilities	0

[1] Resource Extraction for Geographic Information System (reGIS), 17 March 2015

Table 17. Total Length of Extracted Roads for Tangatan Floodplain

Floodplain	Road Network Length (km)					Total
	Barangay Road	City/Municipal Road	Provincial Road	National Road	Others	
Tangatan	87.61	0	17.37	8.82	0	113.80

Table 18. Number of Extracted Water Bodies for Tangatan Floodplain

Floodplain	Water Body Type					Total
	Rivers/Streams	Lakes/Ponds	Sea	Dam	Fish Pen	
Tangatan	20	0	0	0	0	20

A total of 20 bridges and culverts over small channels that are part of the river network were also extracted for the floodplain.

3.12.4 Final Quality Checking of Extracted Features

All extracted ground features were completely given the required attributes. All these output features comprise the flood hazard exposure database for the floodplain. This completes the feature extraction phase of the project.

Figure 25 shows the Digital Surface Model (DSM) of Tangatan Floodplain overlaid with its ground features.

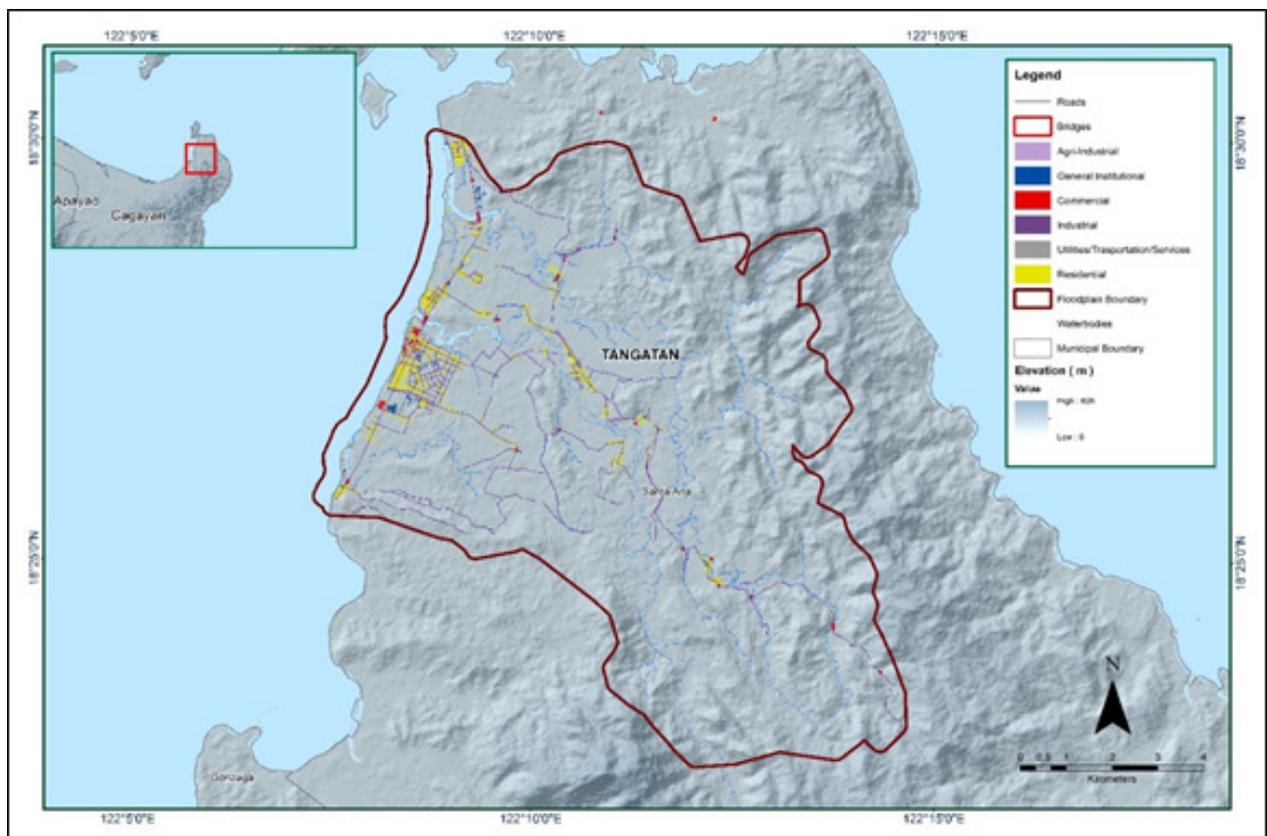

Figure 25. Extracted features for Tangatan Floodplain

CHAPTER 4: LIDAR VALIDATION SURVEY AND MEASUREMENTS OF THE TANGATAN RIVER BASIN

Engr. Louie P. Balicanta, Engr. Joemarie S. Caballero, Ms. Patrizia Mae. P. dela Cruz, Engr. Kristine Ailene B. Borromeo, Ms. Jeline M. Amante, Marie Angelique R. Estipona, Charie Mae V. Manliguez, Engr. Janina Jupiter, Vie Marie Paola M. Rivera

The methods applied in this Chapter were based on the DREAM methods manual (Balicanta et al., 2014) further enhanced and updated in Paringit, et al. (2017).

4.1 Summary of Activities

H.O. Noveloso Surveying (HONS) conducted a field survey in Tangatan River on Jan. 19, 2017, on Jan. 23 to 24, 2017, on Jan. 27 to 28, 2017, on Feb. 7, 2017, on Feb. 9, 2017, on Mar. 17 to 18, 2017, and on Mar. 20, 2017 with the following scope: reconnaissance; control survey; cross-section and as-built survey of Casagan Hanging Bridge in Brgy. Casagan and Sta. Cruz Bridge in Brgy. Sta. Cruz, Municipality of Sta. Ana, Province of Cagayan; and bathymetric survey of the river from the upstream in Brgy. Dungeg to the mouth of the river in Brgy. Tangatan, Sta. Ana, Cagayan with an approximate length of 14.90 km. Random checking points for the contractor's cross-section and bathymetry data were gathered by DVBC on October 11-22, 2016 and on November 30 - December 14, 2016 using an Ohmex™ Single Beam Echo Sounder and Trimble® SPS 882 GNSS PPK survey technique. In addition to this, validation points acquisition survey was conducted covering the Tangatan River Basin area. The entire survey extent is illustrated in Figure 27.

4.2 Control Survey

The GNSS network used for Tangatan River is composed of one (1) loop established on December 1, 2016 occupying the following reference points: CGY-102, a second-order GCP, in Brgy. San Jose, Gonzaga, Cagayan and CG-234, a first-order BM, in Brgy. Diara-Zinungan, Sta. Ana, Cagayan.

One (1) control point was also established in the area: UP-TAN-1 in Brgy. Sta. Cruz, Sta. Ana, Cagayan.

The summary of reference and control points and its location is summarized in Table 19 while GNSS network established is illustrated in Figure 26.

Table 19. List of reference and control points used during the survey in Tangatan River

Figure 28. GNSS receiver set-up, Trimble® SPS 885, at CG-234, located at the approach of Diora Bridge in Brgy. Diora-Zinungan, Sta. Ana, Cagayan

Figure 29. GNSS receiver set-up, Trimble® SPS 985, at UP-TAN-1, located at the approach of Sta. Cruz Bridge in Brgy. Sta. Cruz, Sta. Ana, Cagayan

4.3 Baseline Processing

GNSS Baselines were processed simultaneously in TBC by observing that all baselines have fixed solutions with horizontal and vertical precisions within ± 20 cm and ± 10 cm requirement, respectively. In case where one or more baselines did not meet all of these criteria, masking is performed. Masking is done by removing/masking portions of these baseline data using the same processing software. It is repeatedly processed until all baseline requirements are met. If the reiteration yields out of the required accuracy, resurvey is initiated. Baseline processing result of control points in Tangatan River Basin is summarized in Table 21 generated by TBC software.

Table 21. Baseline Processing Report for Tangatan River Basin Static Survey

Observation	Date of Observation	Solution Type	H. Prec. (Meter)	V. Prec. (Meter)	Geodetic Az.	Ellipsoid Dist. (Meter)	Δ Height (Meter)
UP-TAN-1 --- CGY-102	12-1-2016	Fixed	0.004	0.016	199°11'58"	13609.050	12.344
CGY-102--- CG-234	12-1-2016	Fixed	0.003	0.016	193°23'13"	7169.703	12.671
UP-TAN-1--- CG-234	12-1-2016	Fixed	0.003	0.014	205°35'16"	6516.553	-0.276

As shown in Table 21, a total of three (3) baselines were processed with coordinates of CGY-102 and elevation value of CG-234 held fixed. All of them passed the required accuracy.

4.4 Network Adjustment

After the baseline processing procedure, network adjustment was performed using TBC. Looking at the Adjusted Grid Coordinates table of the TBC generated Network Adjustment Report, it was observed that the square root of the squares of x and y must be less than 20 cm and z less than 10 cm in equation form:

$$\sqrt{((x_e)^2 + (y_e)^2)} < 20cm \text{ and } z_e < 10 \text{ cm}$$

where:

- xe is the Easting Error,
- ye is the Northing Error, and
- ze is the Elevation Error

for each control point. See the Network Adjustment Report shown from Tables 23 to 25 for the complete details.

The three (3) control points, CGY-102, CG-234, and UP-TAN-1, were occupied and observed simultaneously to form a GNSS loop. The coordinates of CGY-102 and elevation value of CG-234 held fixed as presented in Table 22. Through these reference points, the coordinates and elevations of the unknown control points will be computed.

Table 22. Control Point Constraints

Point ID	Type	East σ (Meter)	North σ (Meter)	Height σ (Meter)	Elevation σ (Meter)
CG-234	Grid				Fixed
CGY-102	Global	Fixed	Fixed		
Fixed = 0.000001 (Meter)					

Table 23. Adjusted Grid Coordinates

Point ID	Easting (Meter)	Easting Error (Meter)	Northing (Meter)	Northing Error (Meter)	Elevation (Meter)	Elevation Error (Meter)	Constraint
CG-234	407973.642	0.012	2038248.425	0.010	3.769	?	e
CGY-102	406280.704	?	2031283.618	?	15.911	0.074	LL
UP-TAN-1	410814.670	0.013	2044110.914	0.010	4.510	0.069	

With the mentioned equation, $\sqrt{((x_e)^2+(y_e)^2)} < 20\text{cm}$ for horizontal and $z_e < 10\text{ cm}$ for the vertical; the computation for the accuracy are as follows:

- a. CG-234
 Horizontal Accuracy = $\sqrt{((1.2)^2 + (1.0)^2)}$
 = $\sqrt{1.44 + 1.00}$
 = $1.56 < 20\text{ cm}$
 Vertical Accuracy = Fixed
- b. CGY-102
 Horizontal Accuracy = Fixed
 Vertical Accuracy = $7.4 < 10\text{ cm}$
- c. CG-373
 Horizontal Accuracy = $\sqrt{((1.3)^2 + (1.0)^2)}$
 = $\sqrt{1.69 + 1.00}$
 = $1.69 + 1.00$
 Vertical Accuracy = $6.9 < 10\text{ cm}$

Following the given formula, the horizontal and vertical accuracy result of the three (3) occupied control points are within the required precision.

Table 24. Adjusted Geodetic Coordinates

Point ID	Latitude	Longitude	Ellipsoid	Height	Constraint
CG-234	N18°25'56.68771"	E122°07'42.88274"	40.384	?	e
CGY-102	N18°22'09.82860"	E122°06'46.33709"	53.040	0.074	LL
UP-TAN-1	N18°29'07.85555"	E122°09'18.79066"	40.665	0.069	

The corresponding geodetic coordinates of the observed points are within the required accuracy as shown in Table 24. Based on the result of the computation, the equation is satisfied; hence, the required accuracy for the program was met.

The summary of reference and control points used is indicated in Table 25.

Table 25. Reference and control points used and its location (Source: NAMRIA, UP-TCAGP)

Control Point	Order of Accuracy	Geographic Coordinates (WGS 84)			UTM ZONE 51 N		
		Latitude	Longitude	Ellipsoidal Height (m)	Northing (m)	Easting (m)	BM Ortho (m)

4.5 Cross-section and Bridge As-Built survey and Water Level Marking

Cross-section and as-built surveys were conducted on February 9, 2017 at the downstream side of Casagan Hanging Bridge in Brgy. Casagan, Sta. Ana, Cagayan as shown in Figure 30. A Sokkia™ Set CX Total Station was utilized for this survey as shown in Figure 31. The Automated Water Level System (AWLS) is located beside the foot of the bridge and its elevation was measured 3.713 m above MSL.

Figure 30. Casagan Hanging Bridge facing upstream

Figure 31. Cross-section survey of Casagan Hanging Bridge

The cross-sectional line of Casagan Hanging Bridge is about 82 m with one hundred ninety-two (192) cross-sectional points using the control points UP-TAN-5 and UP-TAN-6 as the GNSS base stations. The location map, cross-section diagram, and the bridge data form are shown from Figures 32 to 34.

Figure 39. Sta. Cruz Bridge Data Sheet

Gathering of random points for the checking of HONS's bridge cross-section and bridge points data was performed by DVBC on October 16, 2016 at Sta. Cruz Bridge using a survey grade GNSS Rover receiver attached to a 2-m pole as seen in Figure 40.

Figure 40. Gathering of random cross-section points along Sta. Cruz Bridge

Linear square correlation (R2) and RMSE analysis were performed on the two (2) datasets for the two (2) bridges. The linear square coefficient range is determined to ensure that the submitted data of the contractor is within the accuracy standard of the project which is ± 20 cm and ± 10 cm for horizontal and vertical, respectively. The R2 value must be within 0.85 to 1. An R2 approaching 1 signifies a strong correlation between the vertical (elevation values) of the two datasets. A computed R2 value of 0.984 was obtained by comparing the data of the contractor and DVBC for the bridge points data of Sta. Cruz Bridge; signifying a strong correlation between the two (2) datasets.

In addition to the Linear Square correlation, Root Mean Square (RMSE) analysis is also performed in order to assess the difference in elevation between the DVBC checking points and the contractor's. The RMSE value should only have a maximum radial distance of 5 m and the difference in elevation within the radius of 5 meters should not be beyond 0.50 m. For the bridge points data of Sta. Cruz Bridge, a computed value of 0.839 was acquired. The computed R2 and RMSE values are within the accuracy requirement of the program.

Water surface elevation of Tangatan River was determined by a Sokkia™ Set CX Total Station on February 9, 2017 at 1:15 PM at Casagan Hanging Bridge area in Brgy. Casagan, Sta. Ana, Cagayan with a value of 0.259 m in MSL as shown in Figure 33. This was translated into marking on the bridge's riprap as shown in Figure 41.

Figure 41. Water level markings on the post of Casagan Hanging Bridge

Water surface elevation of Tangatan River was also determined by a Sokkia™ Set CX Total Station on February 9, 2017 at 9:00 AM at Sta. Cruz Bridge area in Brgy. Sta. Cruz, Sta. Ana, Cagayaan with a value of -0.429 m in MSL as shown in Figure 38. This was translated into marking on the bridge's pier as shown in Figure 42. The markings will serve as reference for flow data gathering and depth gauge deployment of the partner HEI responsible for Tangatan River, the Isabela State University.

Figure 42. Water level marking on the pier of Sta. Cruz Bridge

4.6 Validation Points Acquisition Survey

The Validation Points Acquisition survey was conducted by DVBC on October 16, 2016 using a survey grade GNSS Rover receiver, Trimble® SPS 985, mounted on a range pole which was attached on the side of the vehicle as shown in Figure 43. It was secured with cable ties and ropes to ensure that it was horizontally and vertically balanced. The antenna height was 2.460 m and measured from the ground up to the bottom of the antenna mount of the GNSS Rover receiver. The PPK technique utilized for the conduct of the survey was set to continuous topo mode with CGY-102 occupied as the GNSS base station in the conduct of the survey.

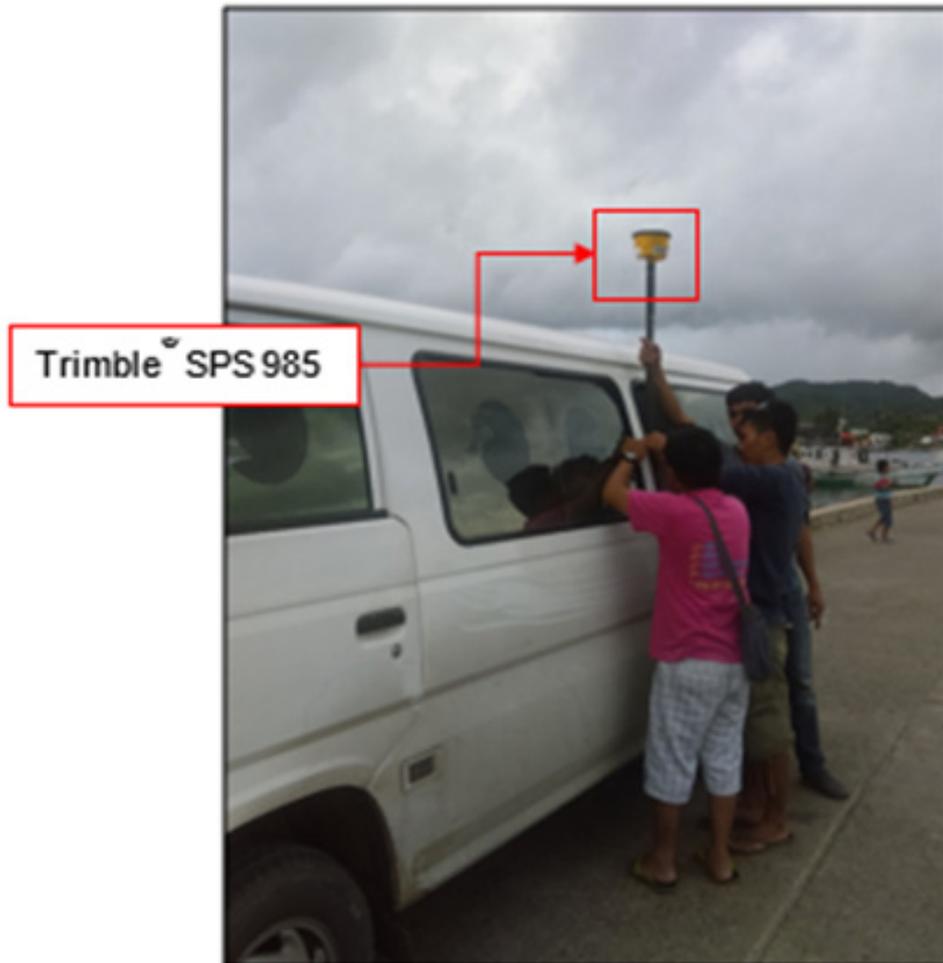

Figure 43. Validation points acquisition survey set-up for Tangatan River

The survey started from Brgy. San Jose, Gonzaga, Cagayan going northeast along the national highway, covering eight (8) barangays in Sta. Ana and ended in Brgy. San Vicente, Sta. Ana, Cagayan. The survey gathered a total of 4,378 points with approximate length of 22.71 km using CGY-102 as GNSS base station for the entire extent of validation points acquisition survey as illustrated in the map in Figure 44.

Figure 44. Validation points acquisition survey coverage for Tangatan River Basin

4.7 River Bathymetric Survey

The Bathymetric Survey was executed on March 17-18, 2017 using a dual frequency Hi-Target™ V30 GNSS GPS and a Hi-Target™ Single Beam Echo Sounder mounted in a motor boat as illustrated in Figure 45. The survey started in Brgy. Casagan, Sta. Ana, Province of Cagayan with coordinates 18° 28' 20.4817" N, 122° 10' 20.5593" E and ended at the mouth of the river in Brgy. Tangatan, also in the Municipality of Sta. Ana, with coordinates 18° 29' 52.1270" N, 122° 08' 52.4664" E.

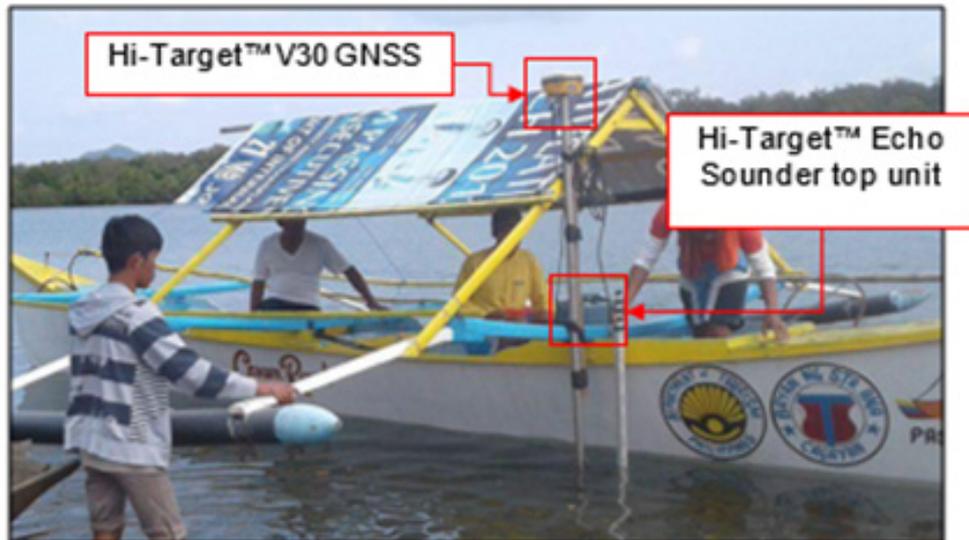

Figure 45. Bathymetric survey along Tangatan River

Manual bathymetric survey, on the other hand, was executed on Feb. 9, 2017, Mar. 17-18, 2017, and Mar. 20, 2017 using a Hi-Target™ V30 GNSS GPS as illustrated in Figure 46. The survey started in Brgy. Dungeg, Municipality of Sta. Ana, Province of Cagayan with coordinates 18° 26' 14.2578" N, 122° 11' 53.8700" E, traversing down the river and ended at starting point of the bathymetric survey using a boat in Brgy. Casagan, also in the Municipality of Sta. Ana. The control points UP-TAN-3, UP-TAN-5, UP-TAN-6, and UP-TAN-7 were used as GNSS base stations all throughout the entire survey.

Figure 46. Manual bathymetric survey of HONS along Tangatan River

Gathering of random points for the checking of HONS's bathymetric data was performed by DVBC on December 2, 2016 using a survey grade GNSS Rover receiver attached to a boat as seen in Figure 48. A map showing the DVBC bathymetric checking points is shown in Figure 49.

Figure 47. Gathering of random bathymetric points along Tangatan River

Linear square correlation (R^2) and RMSE analysis were also performed on the two (2) datasets and a computed R^2 value of 0.091 for the bathymetric data is not within the required range for R^2 , which is 0.85 to 1; however, its maximum value of 0.499 m did not exceed the maximum value of the difference in elevation of 0.5 m. Additionally, an RMSE value of 0.279 for the bathymetric data was obtained. Both the computed R^2 and RMSE values are within the accuracy required by the program.

The bathymetric survey for Tangatan River gathered a total of 2,460 points covering 14.90 km of the river traversing barangays Dungeg, Marede, Casagan, Sta. Cruz, and Tangatan in the Municipality of Sta. Ana. A CAD drawing was also produced to illustrate the riverbed profile of Tangatan River. As shown in Figures 50 and 51, the highest and lowest elevation has a 7.63-m difference.

The highest elevation observed was 4.211 m above MSL located in Brgy. Dunggeg, Sta. Ana, Cagayan while the lowest was -3.423 m below MSL located in Brgy. Sta. Cruz, Sta. Ana, Cagayan.

CHAPTER 5: FLOOD MODELING AND MAPPING

Dr. Alfredo Mahar Lagmay, Christopher Uichanco, Sylvia Sueno, Marc Moises, Hale Ines, Miguel del Rosario, Kenneth Punay, Neil Tingin, Mariel Monteclaro

The methods applied in this Chapter were based on the DREAM methods manual (Lagmay, et al., 2014) and further enhanced and updated in Paringit, et al. (2017)

5.1 Data Used for Hydrologic Modeling

5.1.1 Hydrometry and Rating Curves

The components and data that affect the hydrologic cycle of the river basin were monitored, collected, and analyzed. These include the rainfall, water level, and the flow in a certain period of time.

5.1.2 Precipitation

Cagayan, including the Tangatan River Basin, often experiences heavy and long term rain such as Monsoon Rain during the months of January to March. The hydrologic data collection covered the period of 22 March 2017. Hydrologic data include the river velocity, water depth and rain collected from data logging sensors (mechanical velocity meter, depth gauge and rain gauges) in specific time period. Precipitation data was taken from the Brgy. Santa Clara, Cagayan. The location of the rain gauge is seen in Figure 52.

Total rain from the Santa Clara ARG is 59 mm. It peaked to 6mm on 22 March 2017 7:30 A.M. The lag time between the peak rainfall and discharge is 7 hours and 20 minutes. The ARG for Tangatan River Basin is shown Figure 54.

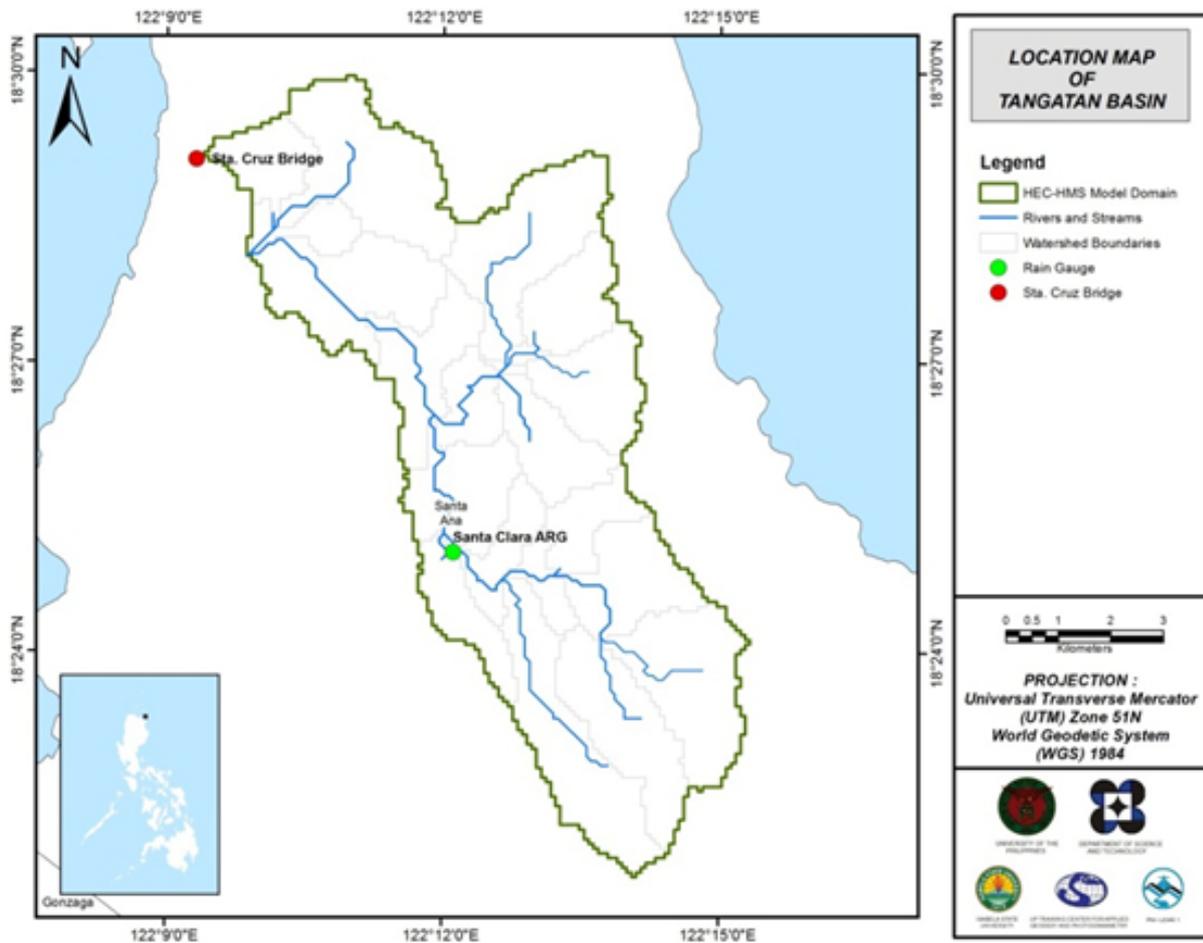

Figure 52. Location map of Tangatan HEC-HMS model used for calibration

5.1.3 Rating Curves and River Outflow

The Monsoon rain that occurred on 22 March 2017 contributed to a 0.768 meter water level rise with peak discharge of 56.5m³/s recorded at 12:20 PM on 22 March 2017 with accumulated rainfall 59 mm. These hydrologic data is the actual event of Tangatan River and inputted to hydrologic modeling. Hydrologic measurements were taken from Sta. Cruz Bridge, Sta. Ana, Cagayan.

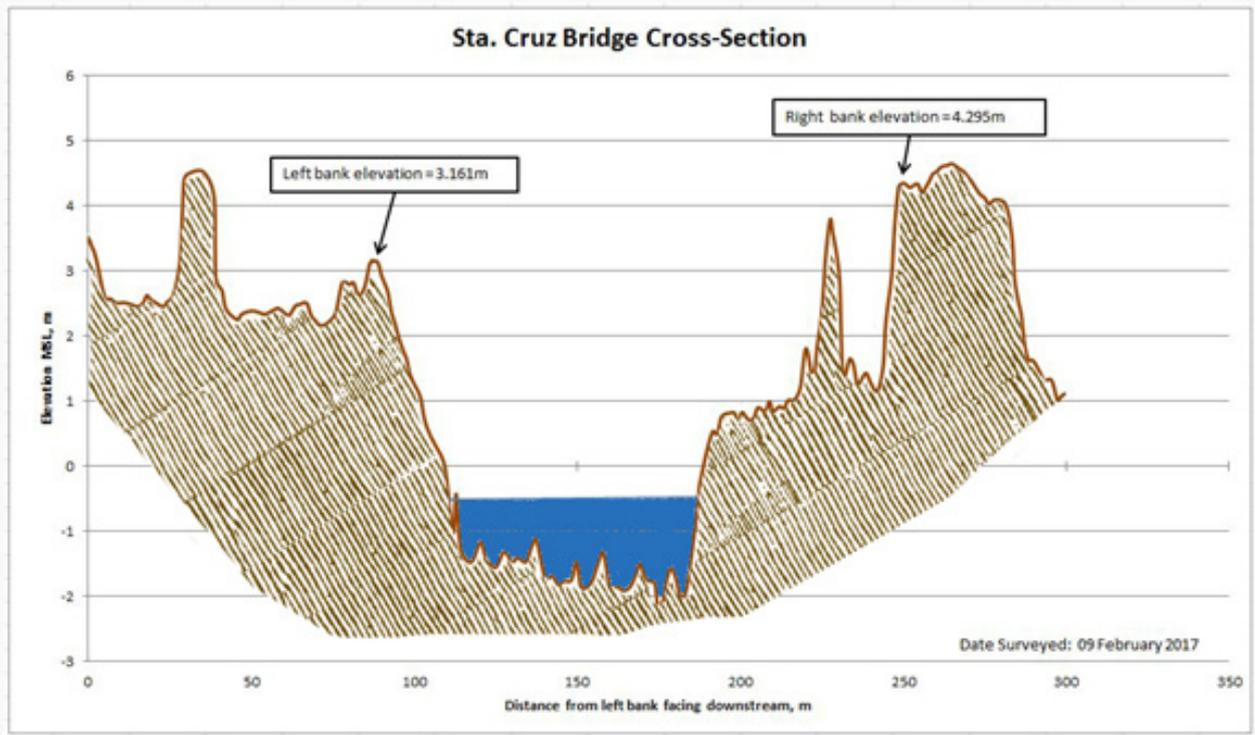

Figure 53. Cross Section Plot of Sta. Cruz Bridge

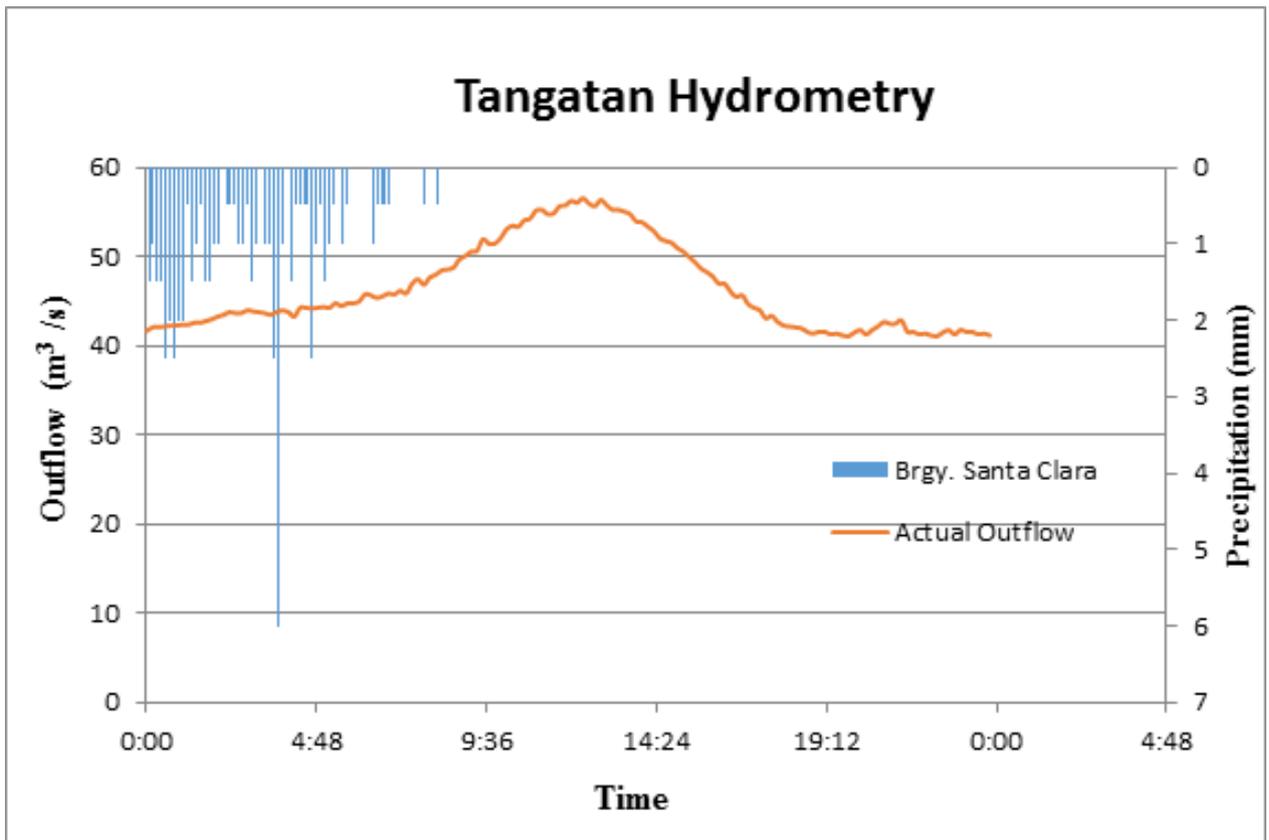

Figure 54. Rainfall and outflow data used for modeling

A rating curve was generated for the observed flow and water level. It shows the relationship of the two hydrologic data. It is expressed in the form of the following equation:

$$Q=anh$$

where,

- Q : Discharge (m³/s),
- h : Gauge height (reading from Sta. Cruz Bridge depth gauge sensor), and
- a and n : Constants.

The Tangatan River Rating Curve measured at Sta Cruz Bridge is expressed as $Q = 36.362e^{0.5738x}$ (Figure 55).

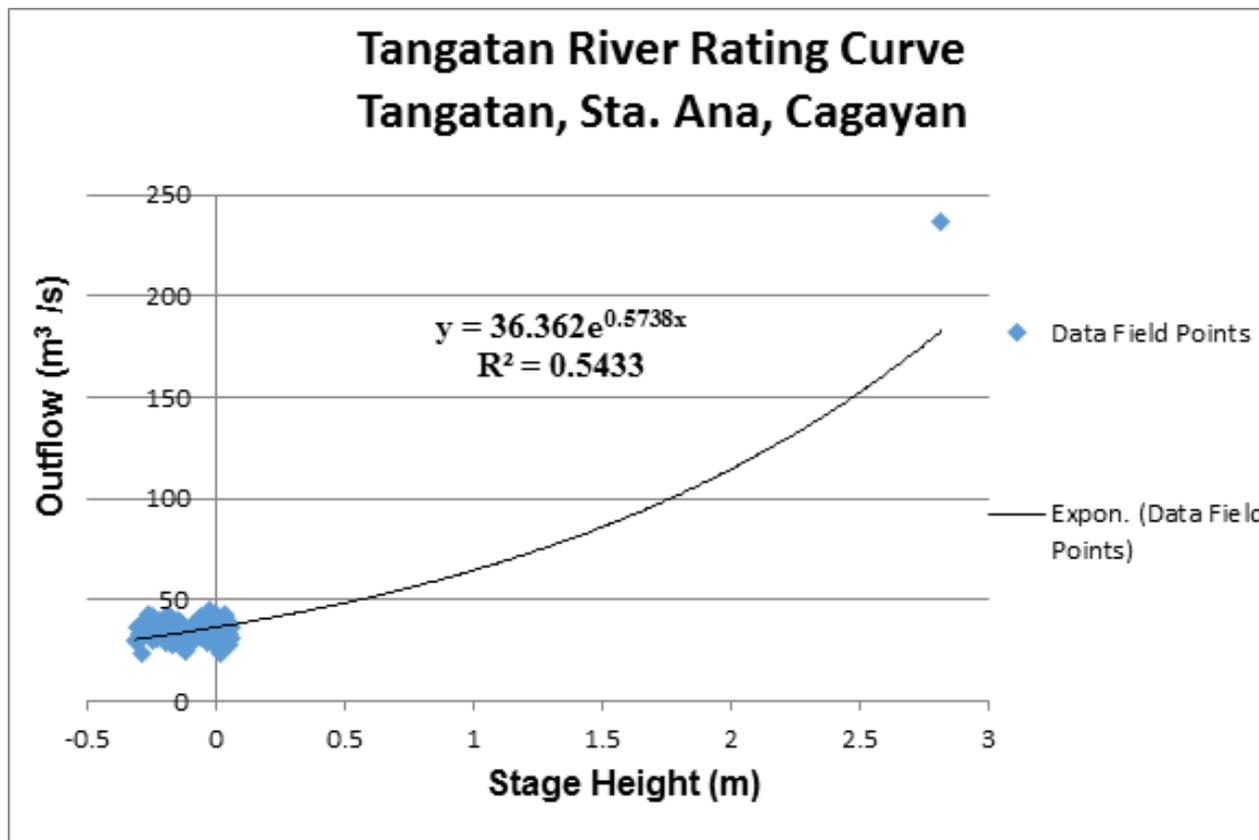

Figure 55. HQ Curve of HEC-HMS model

5.2 RIDF Station

The Philippine Atmospheric Geophysical and Astronomical Services Administration (PAGASA) computed the Rainfall Intensity Duration Frequency (RIDF) values for the Aparri Rain Gauge. The RIDF rainfall amount for 24 hours was converted to a synthetic storm by interpolating and re-arranging the values in such a way a certain peak value will be attained at a certain time. This station was chosen based on its proximity to the Tangatan watershed. The extreme values for this watershed were computed based on a 47-year record.

Table 26. RIDF values for the Aparri Rain Gauge, as computed by PAGASA

COMPUTED EXTREME VALUES (in mm) OF PRECIPITATION									
T (yrs)	10 mins	20 mins	30 mins	1 hr	2 hrs	3 hrs	6 hrs	12 hrs	24 hrs
2	20.1	31.4	39.4	53.3	75.6	92.2	119.4	147.7	167.9
5	28.5	44.9	55.8	78.7	110.4	137	173.6	221.2	252.5
10	34.1	53.8	66.6	95.6	133.4	166.6	209.5	269.9	308.5
15	37.2	58.8	72.7	105.1	146.5	183.4	229.7	297.4	340.2
20	39.4	62.3	77	111.8	155.6	195.1	243.9	316.6	362.3
25	41.1	65	80.3	116.9	162.6	204.1	254.8	331.4	379.3
50	46.3	73.4	90.5	132.7	184.2	231.9	288.4	377.1	431.9
100	51.4	81.7	100.6	148.4	205.6	259.5	321.7	422.4	484

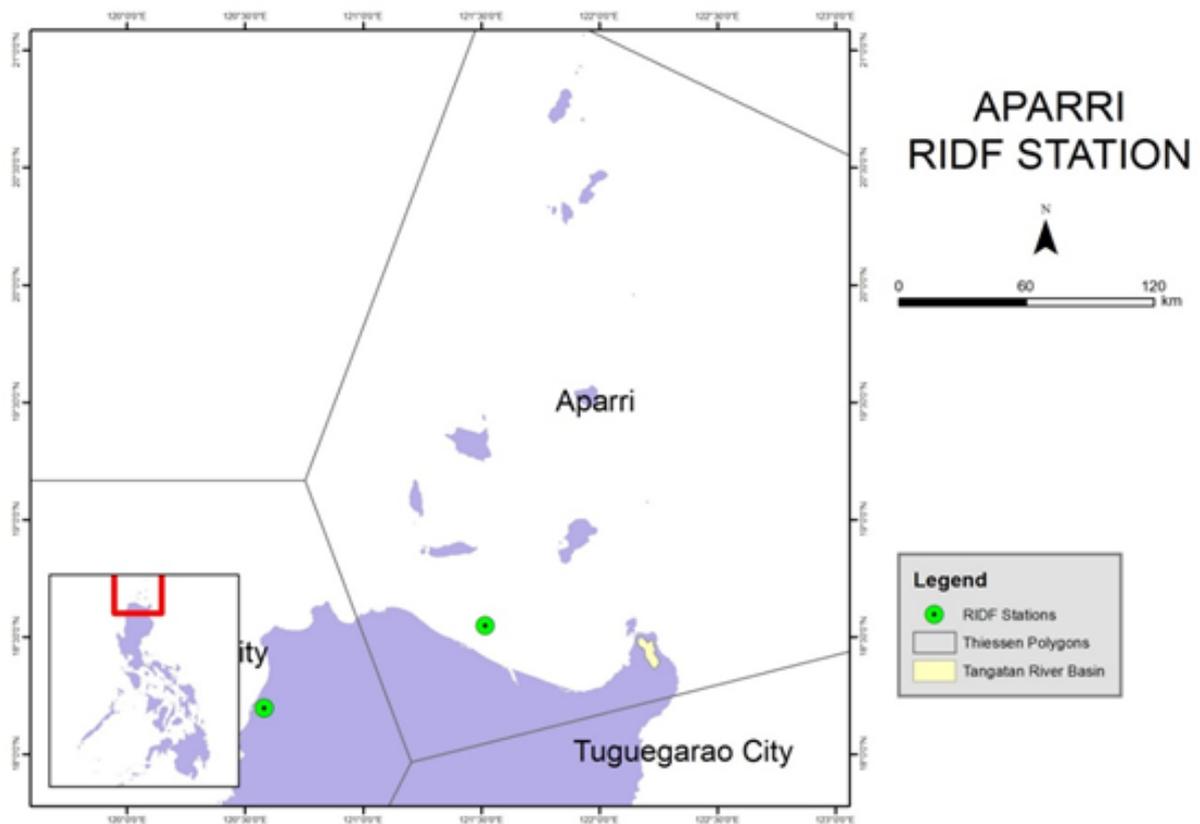

Figure 56. Location of Aparri RIDF Station relative to Tangatan River Basin

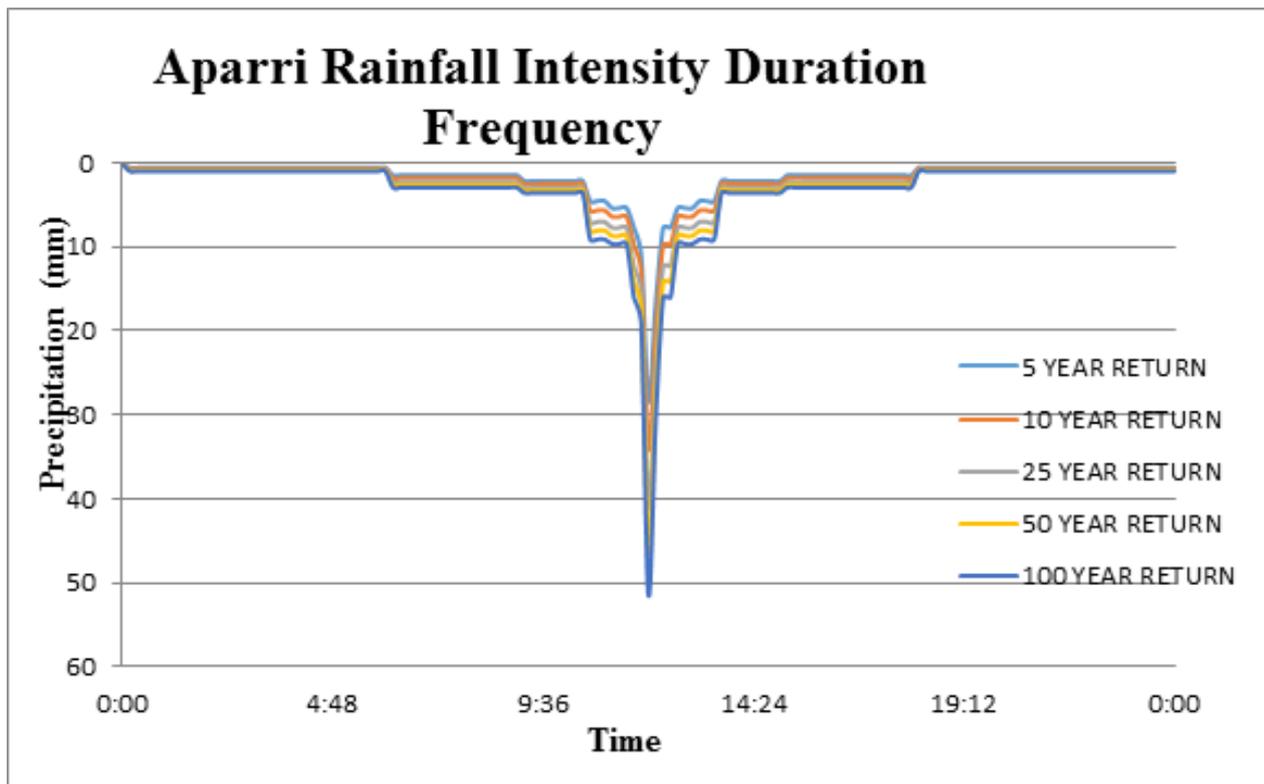

Figure 57. Synthetic storm generated for a 24-hr period rainfall for various return periods

5.3 HMS Model

The soil dataset, taken in 2004, was sourced out from the Bureau of Soils under the Department of Agriculture. The land cover data, on the other hand, was taken from the National Mapping and Resource information Authority (NAMRIA). The soil and land cover of the Tangatan River Basin are shown in Figures 58 and 59, respectively.

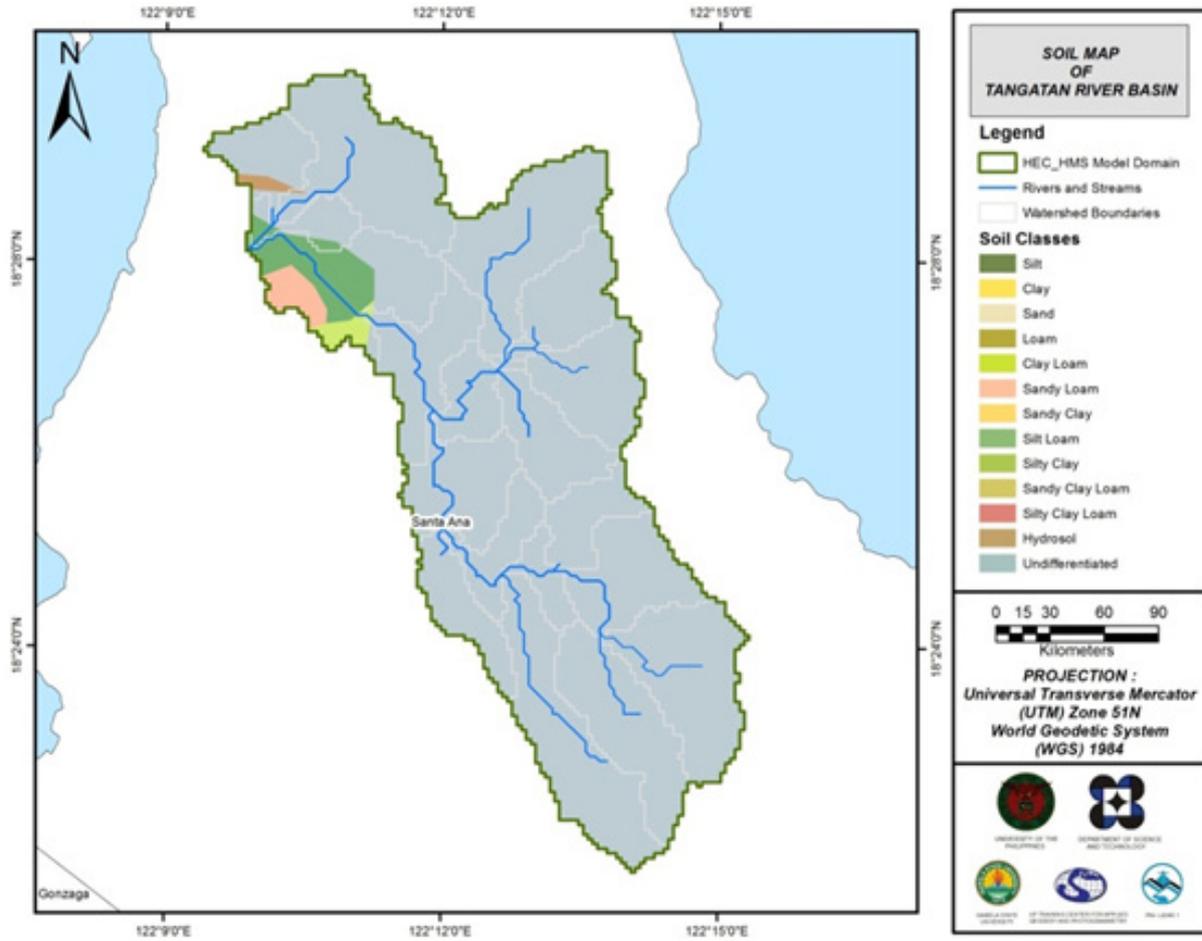

Figure 58. Soil Map of Tangatan River Basin

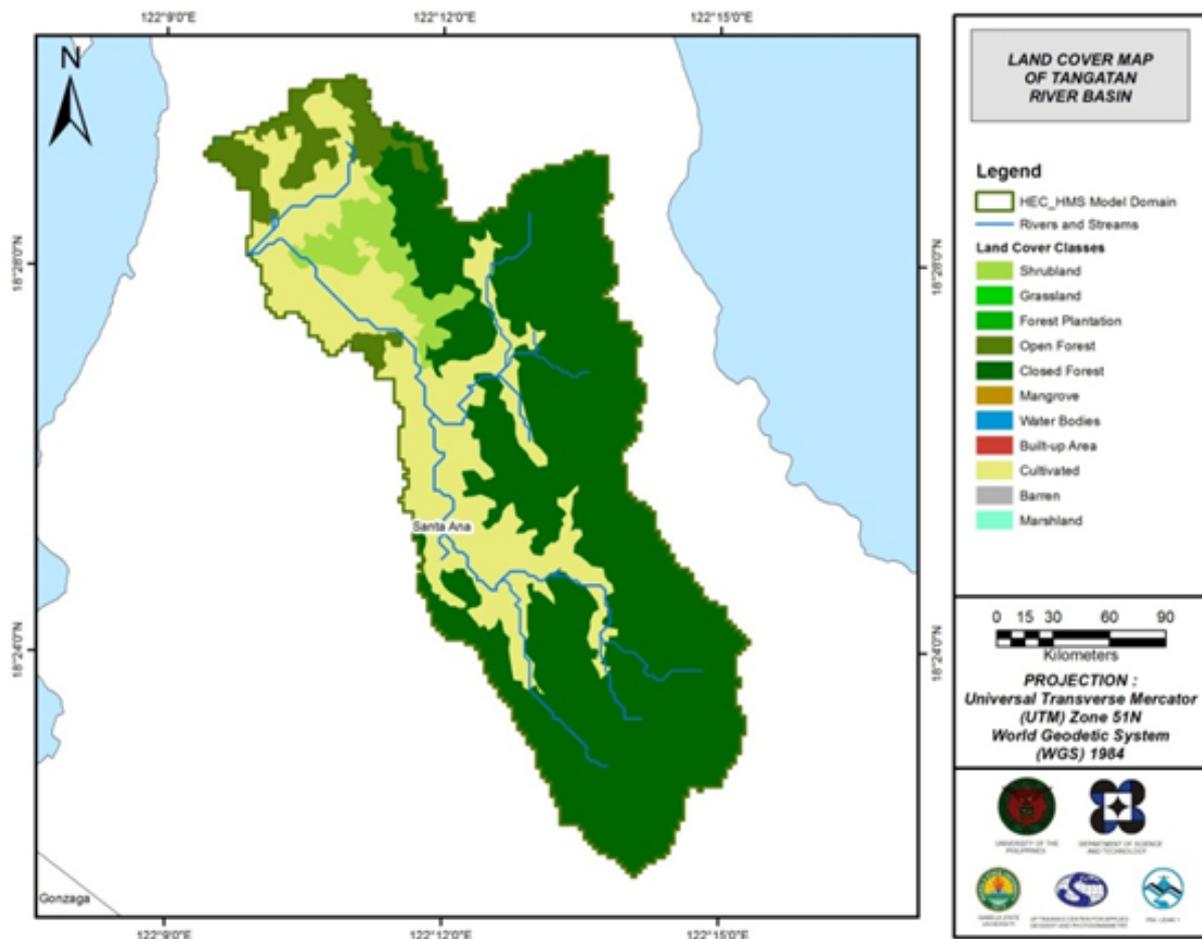

Figure 59. Land Cover Map of Tangatan River Basin

For Tangatan, five (5) soil classes were identified. These are silt, clay loam, sandy loam, hydrosol and undifferentiated soil. Moreover, four (4) land cover classes were identified. These are shrubland, open forest, closed forest, and cultivated area.

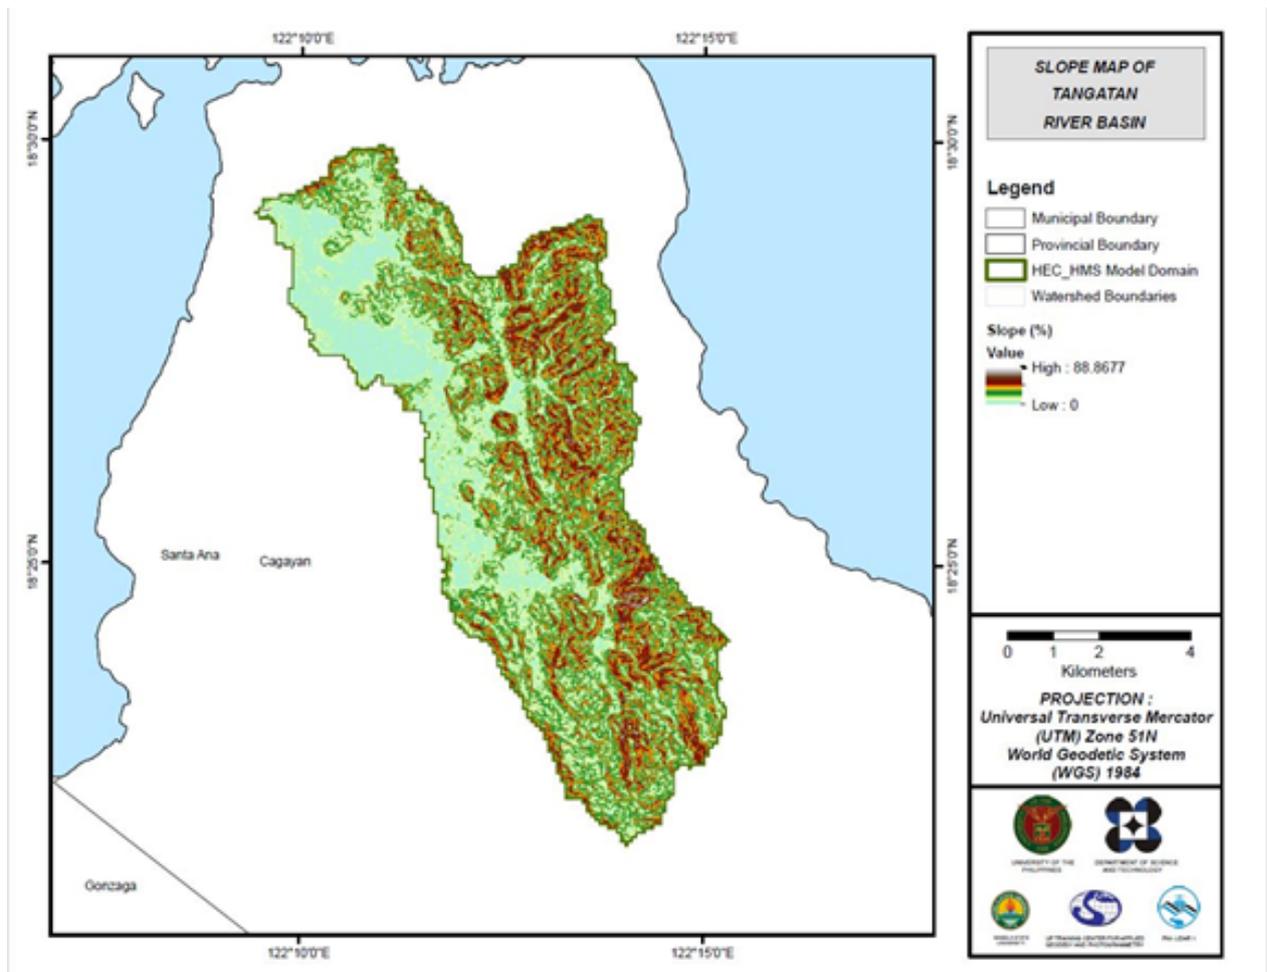

Figure 60. Slope Map of the Tangatan River Basin

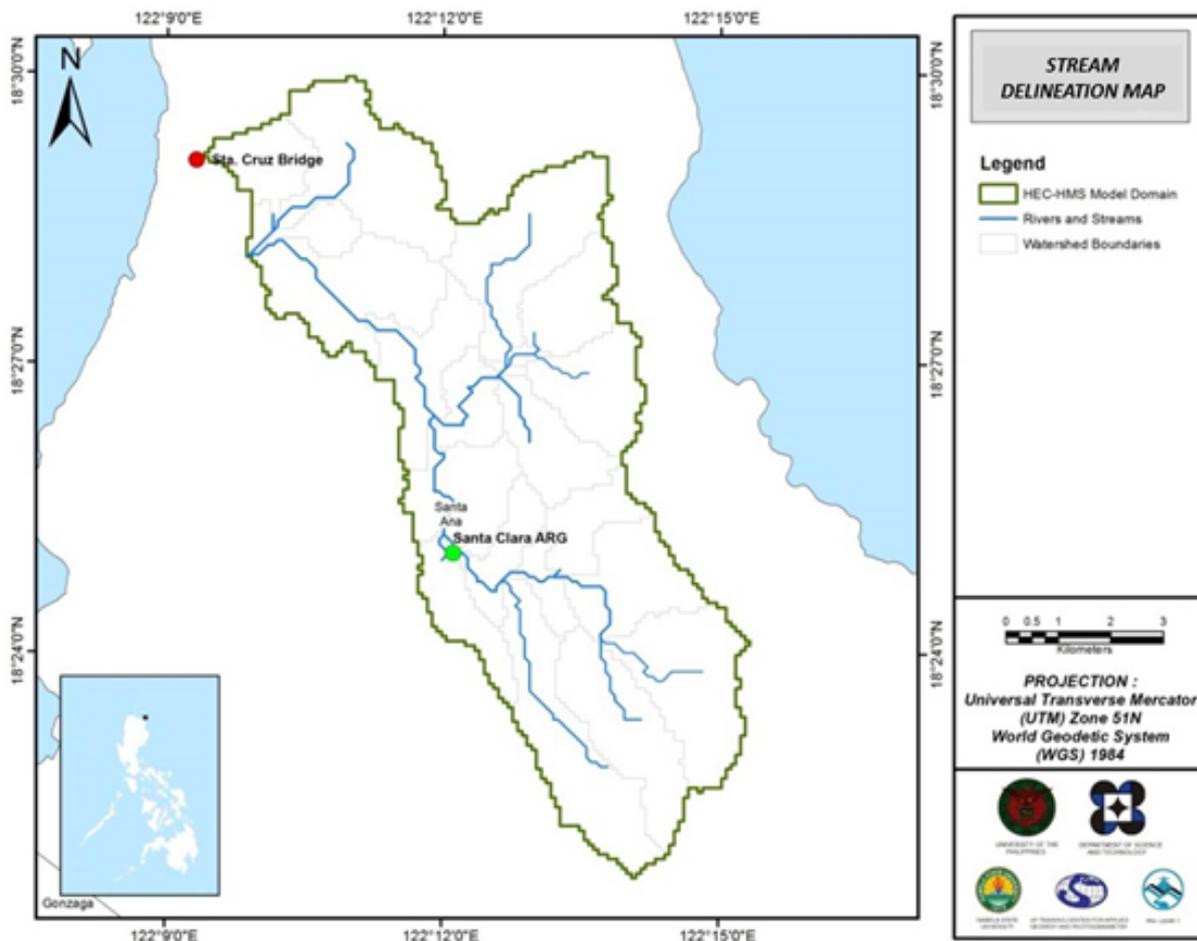

Figure 61. Stream Delineation Map of the Tangatan River Basin

A drainage system includes the basin boundary, subbasin and the stream networks of the basin. Using ArcMap 10.2 with HEC-GeoHMS version 10.2 extension, the Tangatan River centerline and SAR-DEM 10m resolution served as primary data, delineating the drainage system of the Tangatan river basin. The river centerline was digitized starting from upstream towards downstream in Google Earth (2014). Default threshold area used is 140 hectares.

Using the SAR-based DEM, the Tangatan basin was delineated and further subdivided into subbasins. The Tangatan Basin model consists of 22 subbasins, 11 reaches, and 10 junctions. The main outlet is at Outlet 1. This basin model is illustrated in Figure 62. The basins were identified based on soil and land cover characteristics of the area. Precipitation on 22 March 2017 (Monsoon Rain) was taken from the Brgy. Santa Clara ARG. Finally, it was calibrated using data from the Tangatan depth gauge sensor.

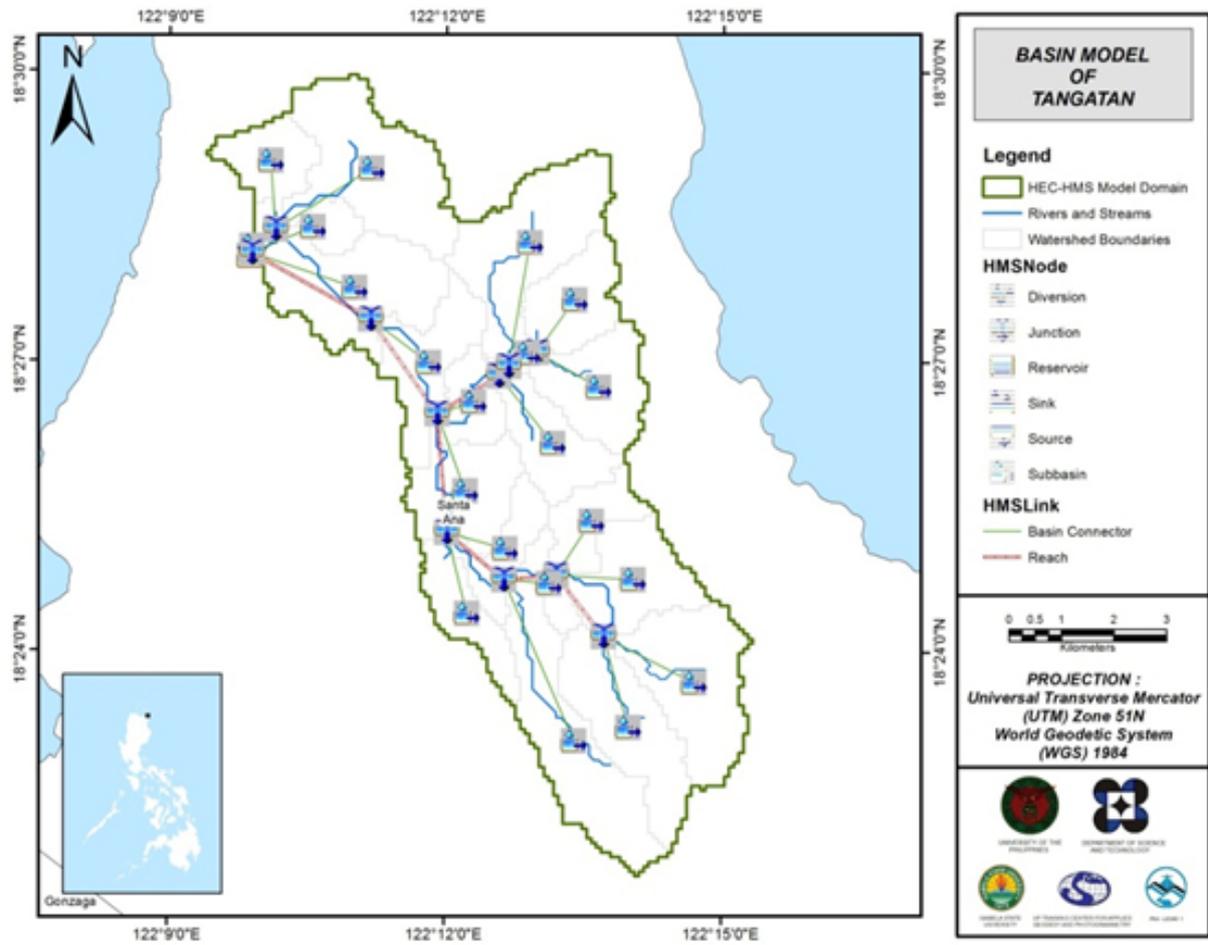

Figure 62. HEC-HMS generated Tangatan River Basin Model

5.4 Cross-section Data

Riverbed cross-sections of the watershed are crucial in the HEC-RAS model setup. The cross-section data for the HEC-RAS model was derived using the LiDAR DEM data. It was defined using the Arc GeoRAS tool and was post-processed in ArcGIS.

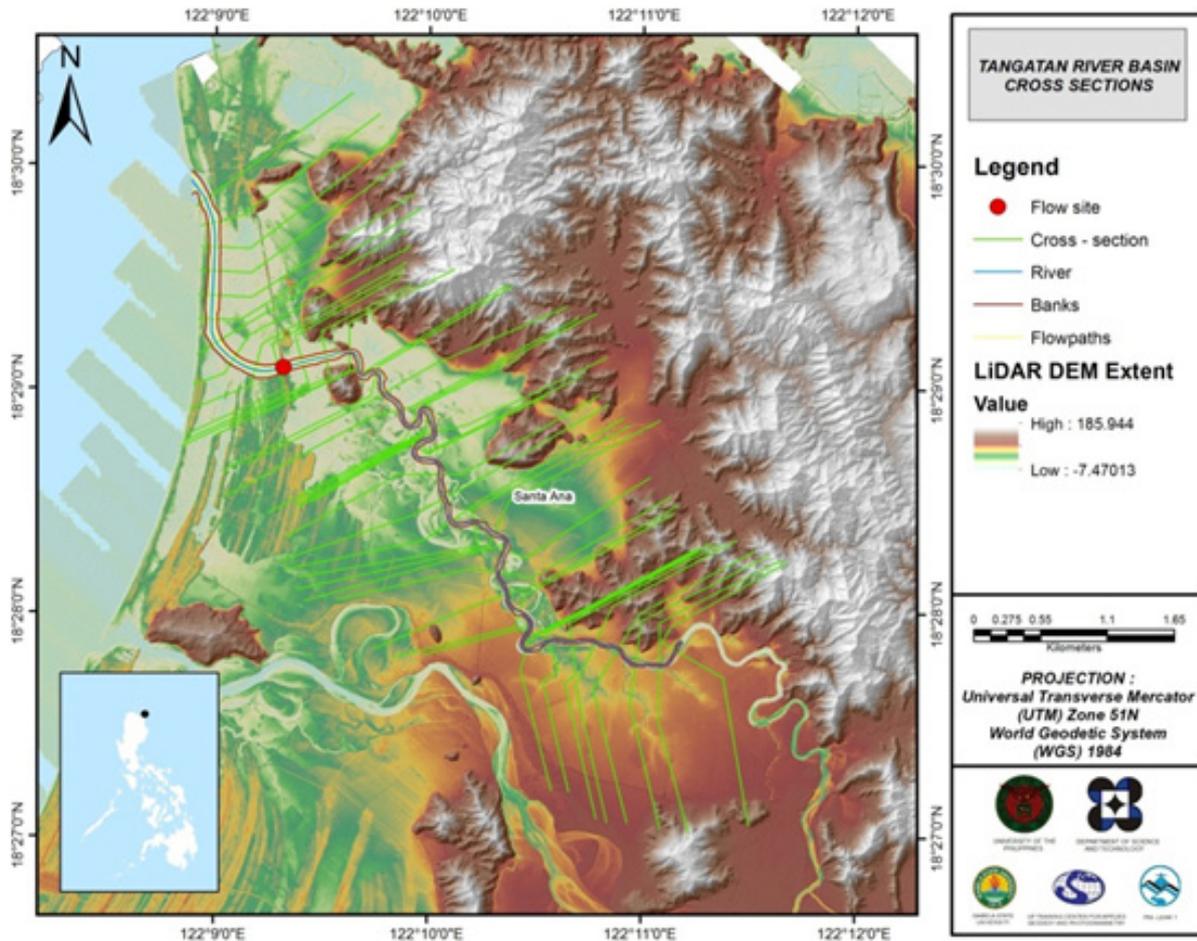

Figure 63. River cross-section of Tangatan River generated through Arcmap HEC GeoRAS tool

5.5 Flo 2D Model

The automated modelling process allows for the creation of a model with boundaries that are almost exactly coincidental with that of the catchment area. As such, they have approximately the same land area and location. The entire area was divided into square grid elements, 10 meter by 10 meter in size. Each element was assigned with a unique grid element number which served as its identifier, then attributed with the parameters required for modelling such as x-and y-coordinate of centroid, names of adjacent grid elements, Manning coefficient of roughness, infiltration, and elevation value. The elements were arranged spatially to form the model, allowing the software to simulate the flow of water across the grid elements and in eight directions (north, south, east, west, northeast, northwest, southeast, southwest).

Based on the elevation and flow direction, it was seen that the water generally flows from the southeast of the model to the northwest, following the main channel. As such, boundary elements in those particular regions of the model were assigned as inflow and outflow elements respectively.

Figure 64. Screenshot of subcatchment with the computational area to be modeled in FLO-2D GDS Pro

The simulation was then run through FLO-2D GDS Pro. This particular model had a computer run time of 96.46191 hours. After the simulation, FLO-2D Mapper Pro was used to transform the simulation results into spatial data showing flood hazard levels, as well as the extent and inundation of the flood. By assigning the appropriate flood depth and velocity values as Low, Medium, and High, the following food hazard map was created. Most of the default values given by FLO-2D Mapper Pro were used, except for those in the Low hazard level. For this particular level, the minimum h (Maximum depth) was set at 0.2 m while the minimum vh (Product of maximum velocity (v) times maximum depth (h)) was set at 0 m²/s.

The creation of a flood hazard map from the model also automatically created a flow depth map depicting the maximum amount of inundation for every grid element. The legend used by default in Flo-2D Mapper was not a good representation of the range of flood inundation values, so a different legend was used for the layout. In this particular model, the inundated parts covered a maximum land area of 102 842 592.00 m².

There was a total of 128 535 709.02 m³ of water entering the model. Of this amount, 52 256 677.55 m³ was due to rainfall while 76 279 031.48 m³ was inflow from other areas outside the model. 15 800 858.00 m³ of this water was lost to infiltration and interception, while 40 272 552.26 m³ was stored by the floodplain. The rest, amounting up to 72 462 374.91 m³, was outflow.

5.6 Results of HMS Calibration

After calibrating the Tangatan HEC-HMS river basin model, its accuracy was measured against the observed values. Figure 65 shows the comparison between the two discharge data.

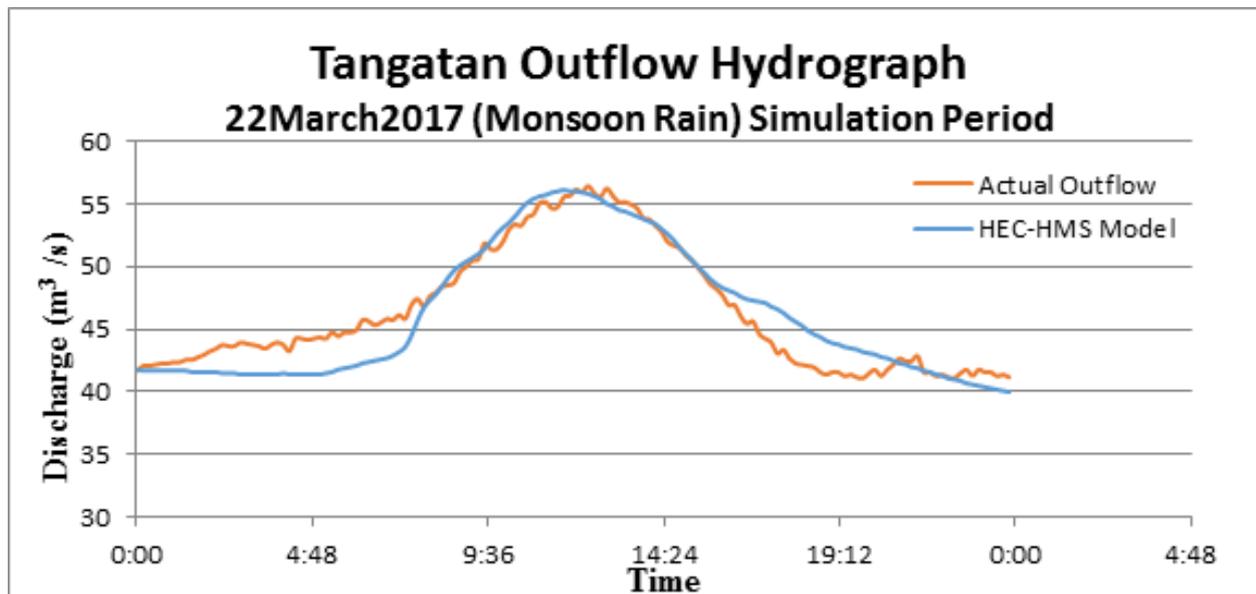

Figure 65. Outflow Hydrograph of Tangatan produced by the HEC-HMS model compared with observed outflow

Enumerated in Table 27 are the adjusted ranges of values of the parameters used in calibrating the model.

Table 27. Range of Calibrated Values for Tangatan

Hydrologic Element	Calculation Type	Method	Parameter	Range of Calibrated Values
Basin	Loss	SCS Curve number	Initial Abstraction (mm)	14.31 – 36.52
			Curve Number	67.82 - 92.92
	Transform	Clark Unit Hydrograph	Time of Concentration (hr)	0.22 – 5.31
			Storage Coefficient (hr)	0.50 – 8.93
	Baseflow	Recession	Recession Constant	0.55 – 1
			Ratio to Peak	0.5
Reach	Routing	Muskingum-Cunge	Manning's Coefficient	0.016 – 0.08

Initial abstraction defines the amount of precipitation that must fall before surface runoff. The magnitude of the outflow hydrograph increases as initial abstraction decreases. The range of values from 14.31mm to 36.52mm means that there is an average amount of infiltration or rainfall interception by vegetation.

The curve number is the estimate of the precipitation excess of soil cover, land use, and antecedent moisture. The magnitude of the outflow hydrograph increases as curve number increases. The range for the curve number of Tangatan River Basin is 67.82 to 92.92. For Tangatan, the basin mostly consists of closed forest and cultivated areas and the soil mostly consists of undifferentiated soil.

The time of concentration and storage coefficient are the travel time and index of temporary storage of runoff in a watershed. The range of calibrated values from 0.22 hours to 8.93 hours determines the reaction time of the model with respect to the rainfall. The peak magnitude of the hydrograph also decreases when these parameters are increased.

Recession constant is the rate at which baseflow recedes between storm events, while ratio to peak is the ratio of the baseflow discharge to the peak discharge. Recession constant of 0.55 - 1 indicates that the basin is highly unlikely to quickly go back to its original discharge and instead, will be higher. Ratio to peak of 0.5 indicates a steep receding limb of the outflow hydrograph.

Manning's roughness coefficient of 0.016 - 0.08 corresponds to the common roughness in Tangatan watershed, which is determined to have scattered brush with heavy weeds (Brunner, 2010).

Table 28. Summary of the Efficiency Test of Tangatan HMS Model

Accuracy measure	Value
RMSE	0.8947
r^2	0.88
NSE	0.49
PBIAS	0.35
RSR	0.21

The Root Mean Square Error (RMSE) method aggregates the individual differences of these two measurements. It was computed as 1.7 (m³/s).

The Pearson correlation coefficient (r^2) assesses the strength of the linear relationship between the observations and the model. This value being close to 1 corresponds to an almost perfect match of the observed discharge and the resulting discharge from the HEC HMS model. Here, it measured 0.8947.

The Nash-Sutcliffe (E) method was also used to assess the predictive power of the model. Here the optimal value is 1. The model attained an efficiency coefficient of 0.88. A positive Percent Bias (PBIAS) indicates a model's propensity towards under-prediction. Negative values indicate bias towards over-prediction. Again, the optimal value is 0. In the model, the PBIAS is 0.49.

The Observation Standard Deviation Ratio, RSR, is an error index. A perfect model attains a value of 0 when the error in the units of the valuable a quantified. The model has an RSR value of 0.35.

5.7 Calculated outflow hydrographs and discharge values for different rainfall return periods

5.7.1 Hydrograph using the Rainfall Runoff Model

The summary graph (Figure 66) shows the Tangatan River outflow using the Aparri Rainfall Intensity-Duration-Frequency curves (RIDF) in 5 different return periods (5-year, 10-year, 25-year, 50-year, and 100-year rainfall time series) based on the Philippine Atmospheric Geophysical and Astronomical Services Administration (PAG-ASA) data. The simulation results reveal significant increase in outflow magnitude as the rainfall intensity increases for a range of durations and return periods.

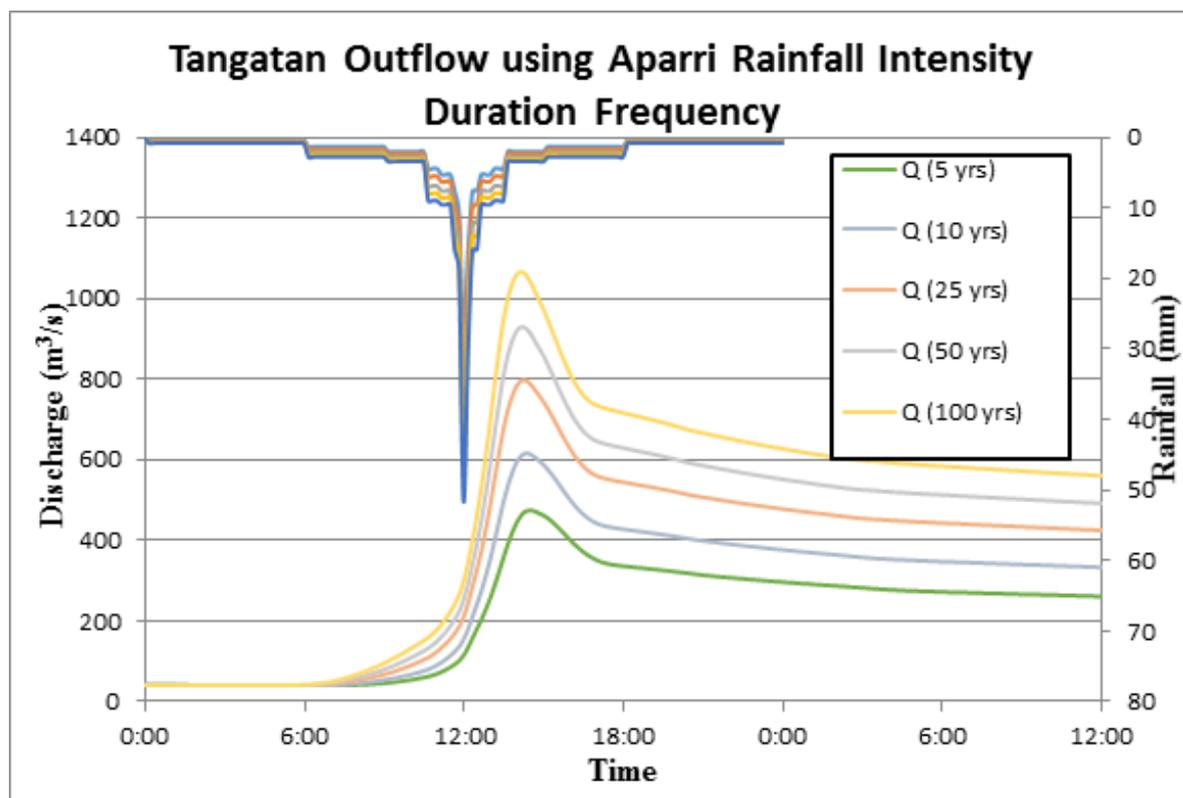

Figure 66. Outflow hydrograph at Tangatan Station generated using Maasin RIDF simulated in HEC-HMS

A summary of the total precipitation, peak rainfall, peak outflow and time to peak of the Tangatan discharge using the Aparri Rainfall Intensity-Duration-Frequency curves (RIDF) in five different return periods is shown in Table 29.

Table 29. Peak values of the Tangatan HEC-HMS Model outflow using the Aparri RIDF

RIDF Period	Total Precipitation (mm)	Peak rainfall (mm)	Peak outflow (m ³ /s)	Time to Peak
5-Year	252.5	28.5	473.1	2 hours, 30 minutes
10-Year	308.5	34.1	615.9	2 hours, 20 minutes
25-Year	379.3	41.1	796.5	2 hours, 10 minutes
50-Year	431.9	46.3	930.1	2 hours, 10 minutes
100-Year	484	51.4	1064.2	2 hours, 10 minutes

5.8 River Analysis (RAS) Model Simulation

The HEC-RAS Flood Model produced a simulated water level at every cross-section for every time step for every flood simulation created. The resulting model was used in determining the flooded areas within the model. The simulated model is an integral part in determining real-time flood inundation extent of the river after it has been automated and uploaded on the DREAM website. For this publication, only a sample output map river will be shown. The sample generated map of Tangatan River using the calibrated HMS is shown in Figure 67.

Figure 67. Sample output of Tangatan RAS Model

5.9 Flow Depth and Flood Hazard

The resulting hazard and flow depth maps have a 10m resolution. Figures 68 to 73 show the 5-, 25-, and 100-year rain return scenarios of the Tangatan Floodplain. The floodplain, with an area of 167.09 sq. km., covers two municipalities namely Gonzaga and Santa Ana. Table 30 shows the percentage of area affected by flooding per municipality.

Table 30. Municipalities affected in Tangatan Floodplain

Municipality	Total Area	Area Flooded	% Flooded
Gonzaga	497.62	0.32	0.06%
Santa Ana	437.13	166.76	38%

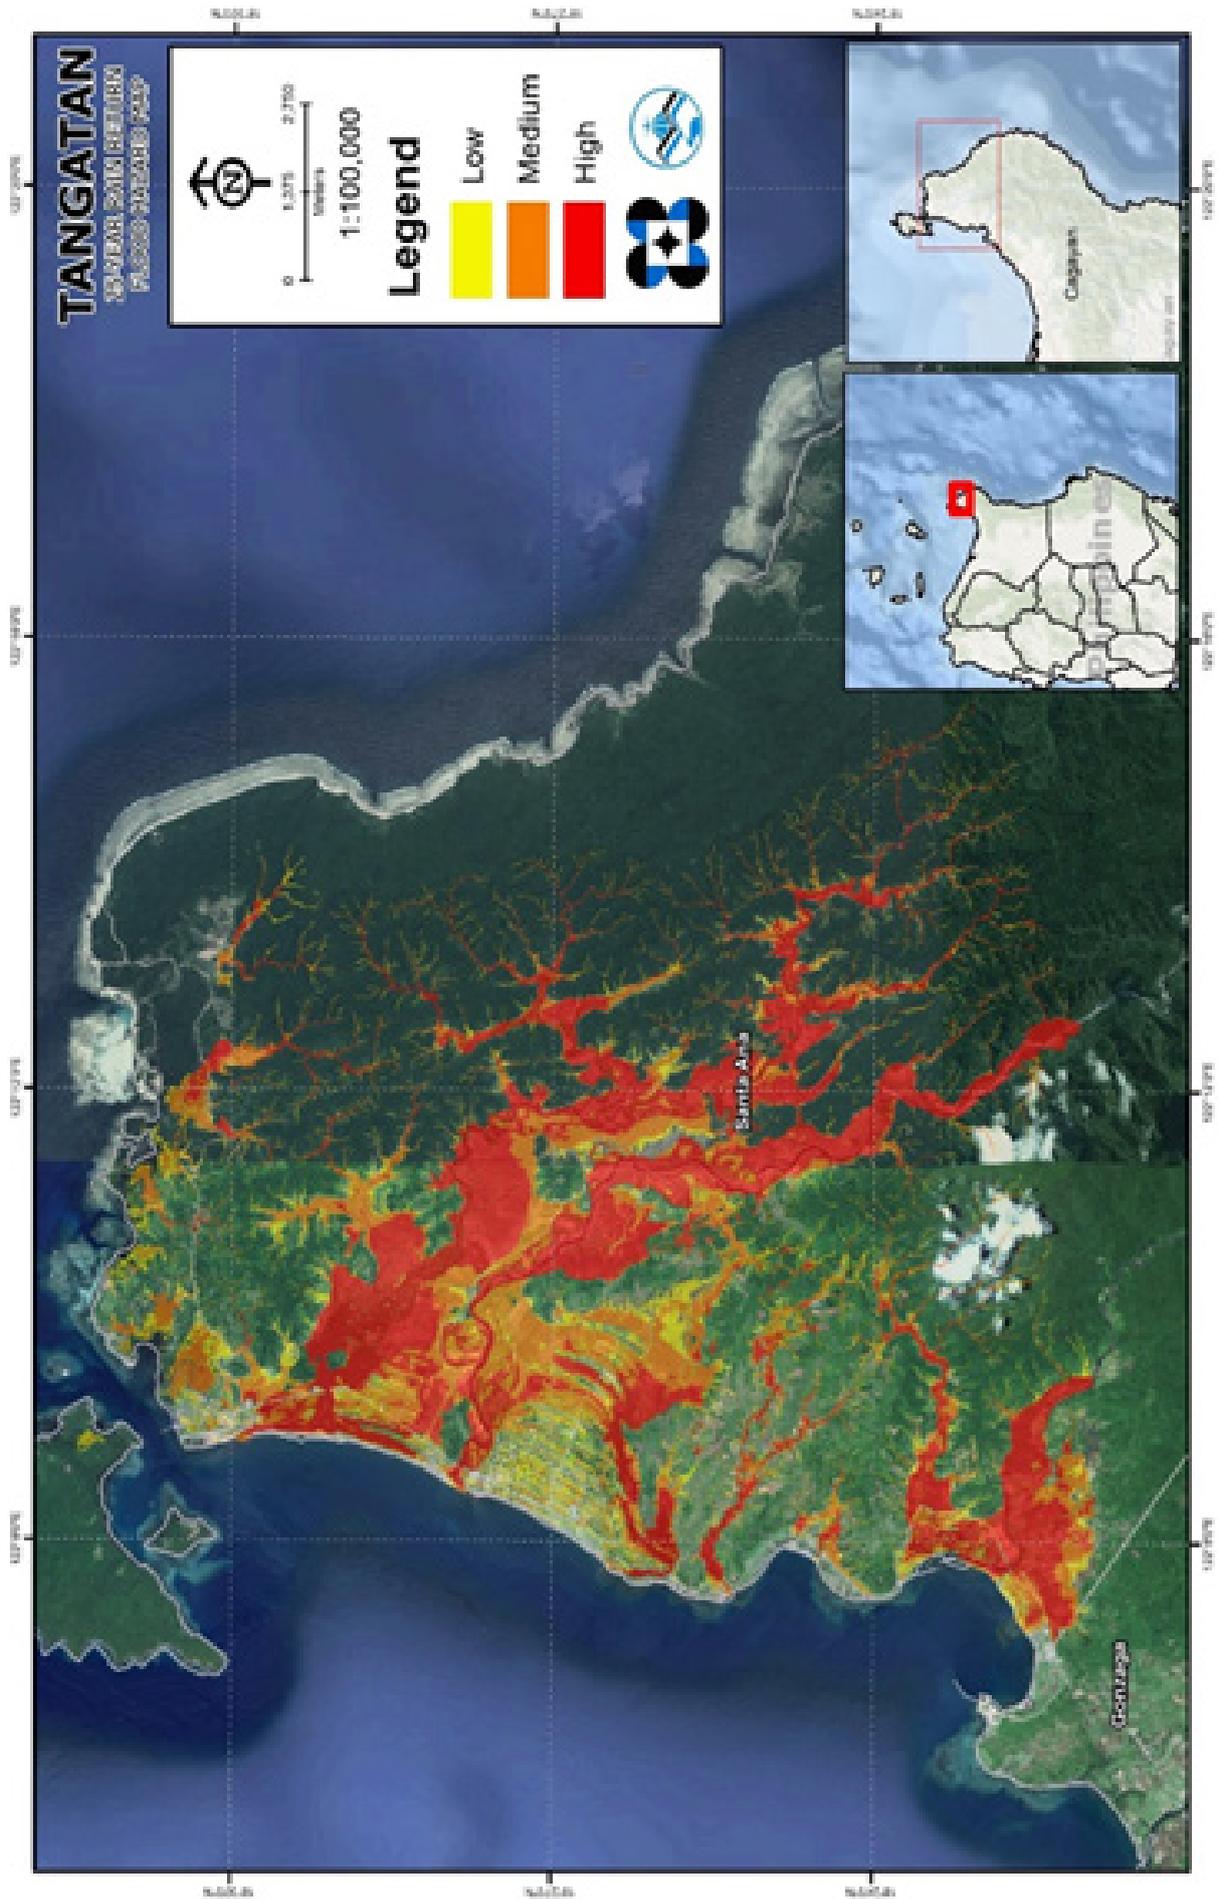

Figure 70. 25-year Flood Hazard Map for Tangatan Floodplain overlaid in Google Earth imagery

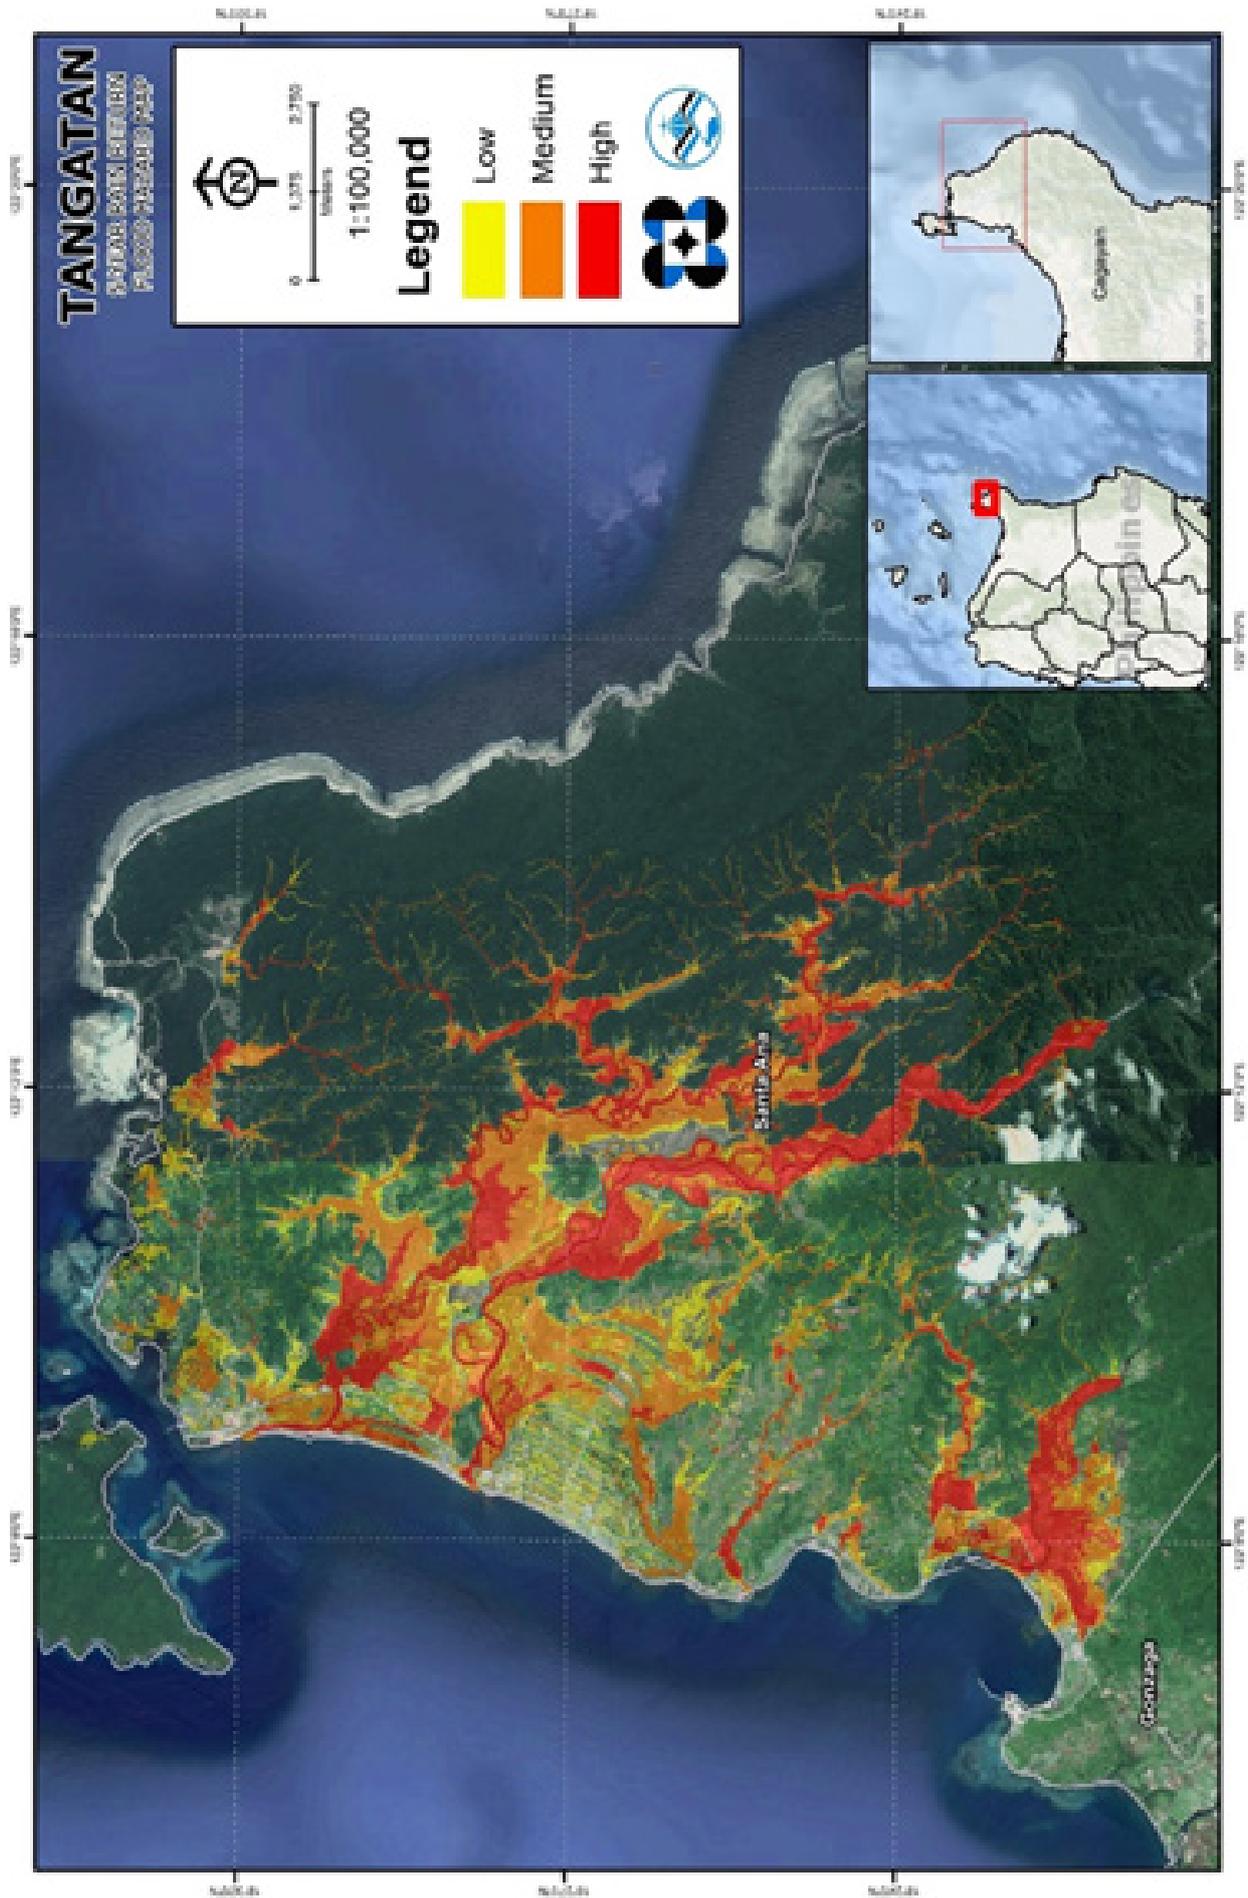

Figure 72. 5-year Flood Hazard Map for Tangatan Floodplain overlaid in Google Earth imagery

5.10 Inventory of Areas Exposed to Flooding

Affected barangays in Tangatan River Basin, grouped by municipality, are listed below. For the said basin, two municipalities consisting of 17 barangays are expected to experience flooding when subjected to 5-, 25-, and 100-yr rainfall return period.

For the 5-year return period, 0.06% of the Municipality of Gonzaga with an area of 497.62 sq. km. will experience flood levels of less than 0.20 meters. 0.00% of the area will experience flood levels of 0.21 to 0.50 meters while 0.00% of the area will experience flood depths of 0.51 to 1 meter. Listed in Table 31 are the affected areas in square kilometers by flood depth per barangay.

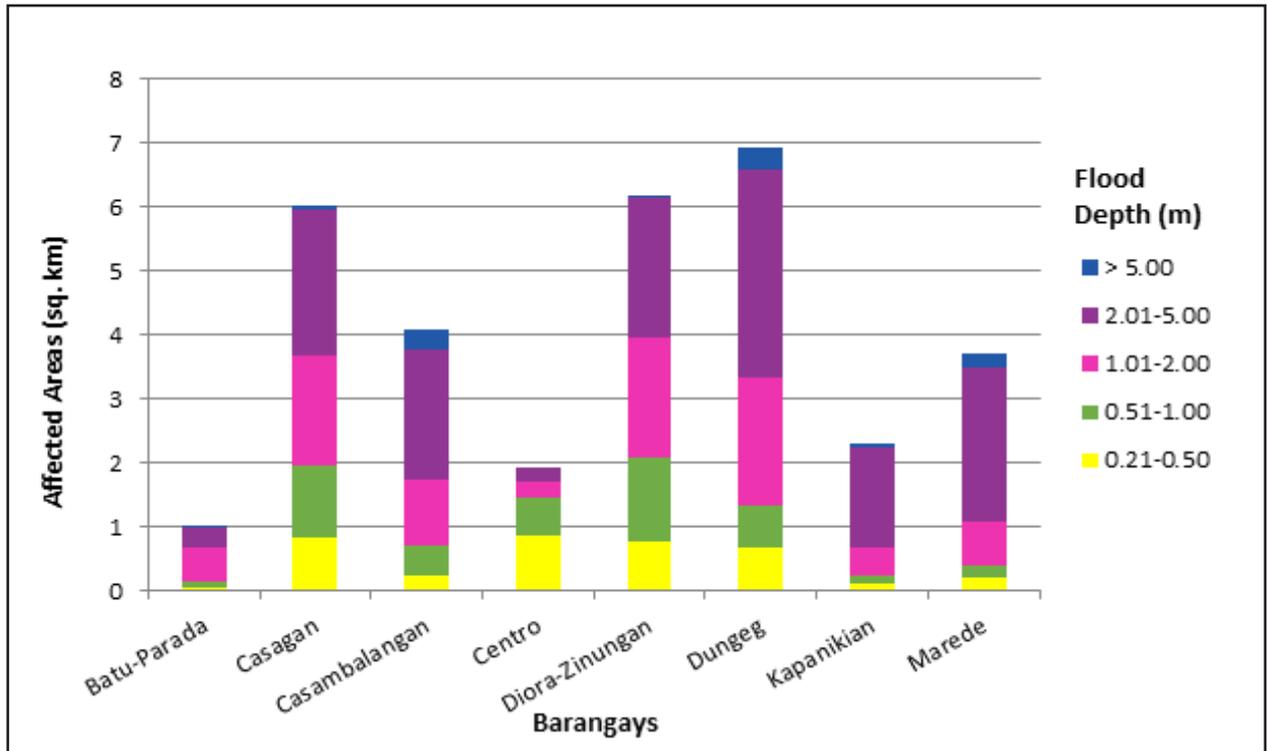

Figure 81. Affected Areas in Santa Ana, Cagayan during 100-Year Rainfall Return Period

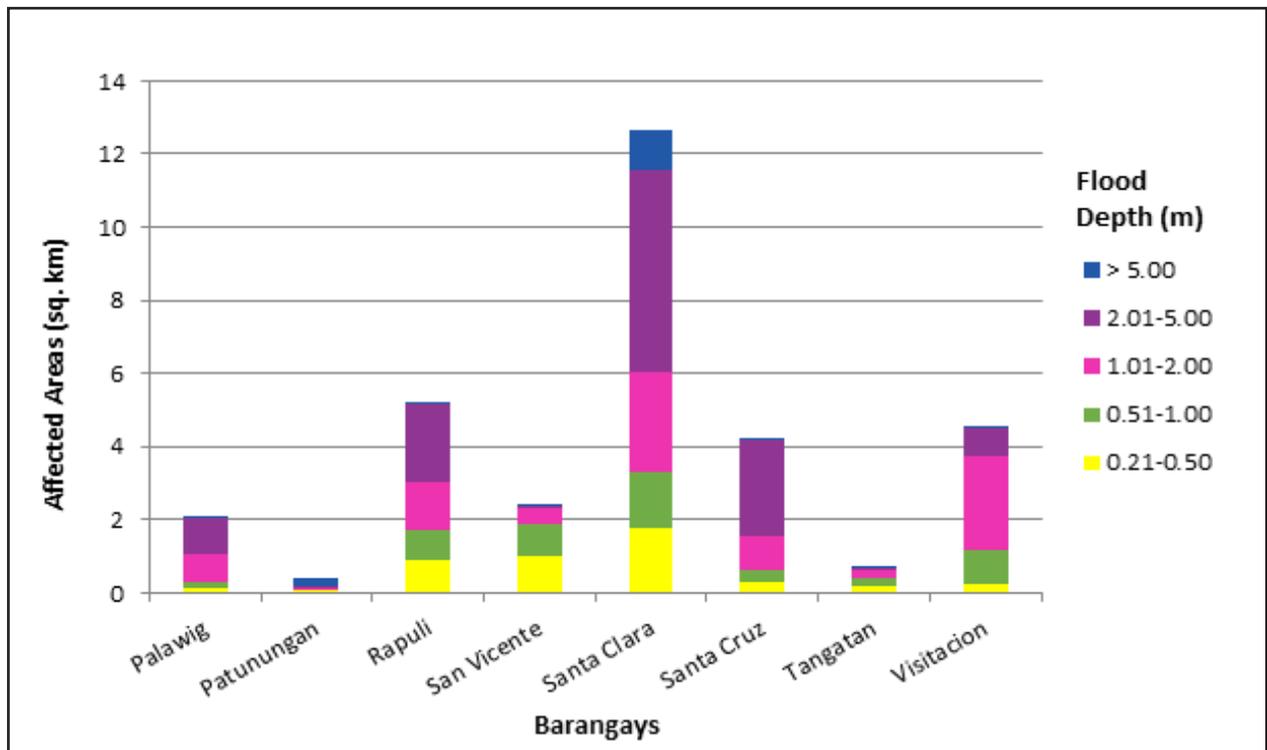

Figure 82. Affected Areas in Santa Ana, Cagayan during 100-Year Rainfall Return Period

The Brgy. San Jose is the only barangay affected in the Municipality of Gonzaga in Cagayan. The barangay is projected to experience flood in 0.06% of the municipality.

Among the barangays in the municipality of Santa Ana in Cagayan, Santa Clara is projected to have the highest percentage of area that will experience flood levels at 10.17%. Meanwhile, Casagan posted the second highest percentage of area that may be affected by flood depths at 4.09%.

Moreover, the generated flood hazard maps for the Tangatan Floodplain were used to assess the vulnerability of the educational and medical institutions in the floodplain. Using the flood depth units of PAG-ASA for hazard maps (“Low”, “Medium”, and “High”), the affected institutions were given their individual assessment for each Flood Hazard Scenario (5-year, 25-year, and 10-year).

Table 40. Areas covered by each warning level with respect to the rainfall scenarios

Warning Level	Area Covered in sq. km.		
	5 year	25 year	100 year
Low	11.32	9.30	8.23
Medium	23.91	20.31	18.06
High	18.94	31.53	38.54
TOTAL	54.17	61.14	64.83

Of the 14 identified educational institutions in Tangatan Floodplain, five (5) schools were discovered exposed to Low-level flooding while five (5) schools were found exposed to Medium-level flooding, both during the 5-year scenario.

For the 25-year scenario, four (4) schools were discovered exposed to Low-level flooding while six (6) schools were found exposed to Medium-level flooding. In the same scenario, one (1) school was discovered exposed to High-level flooding.

For the 100-year scenario, three (3) schools were discovered exposed to Low-level flooding while five (5) schools were found exposed to Medium-level flooding. In the same scenario, one (3) schools were discovered exposed to High-level flooding.

Of the six (6) identified medical or health institutions in Tangatan Floodplain, two (2) medical institutions were discovered exposed to Low-level flooding.

For the 25-year scenario, two (2) health institutions were discovered exposed to Low-level flooding.

For the 100-year scenario, one (1) health institution was discovered exposed to Low-level flooding while one (1) medical institution was found exposed to Medium-level flooding.

5.11 Flood Validation

In order to check and validate the extent of flooding in different river systems, there is a need to perform validation survey work. Field personnel gathered secondary data regarding flood occurrence in the area within the major river system in the Philippines.

From the Flood Depth Maps produced by Phil-LiDAR 1 Program, multiple points representing the different flood depths for different scenarios were identified for validation.

The validation personnel went to the specified points identified in a river basin and gathered data regarding the actual flood level in each location. Data gathering was done through a local DRRM office to obtain maps or situation reports about the past flooding events or interview some residents with knowledge of or have had experienced flooding in a particular area.

After which, the actual data from the field were compared to the simulated data to assess the accuracy of the Flood Depth Maps produced and to improve on what is needed.

The flood validation consists of 226 points randomly selected all over the Tangatan Floodplain. It has an RMSE value of 0.77.

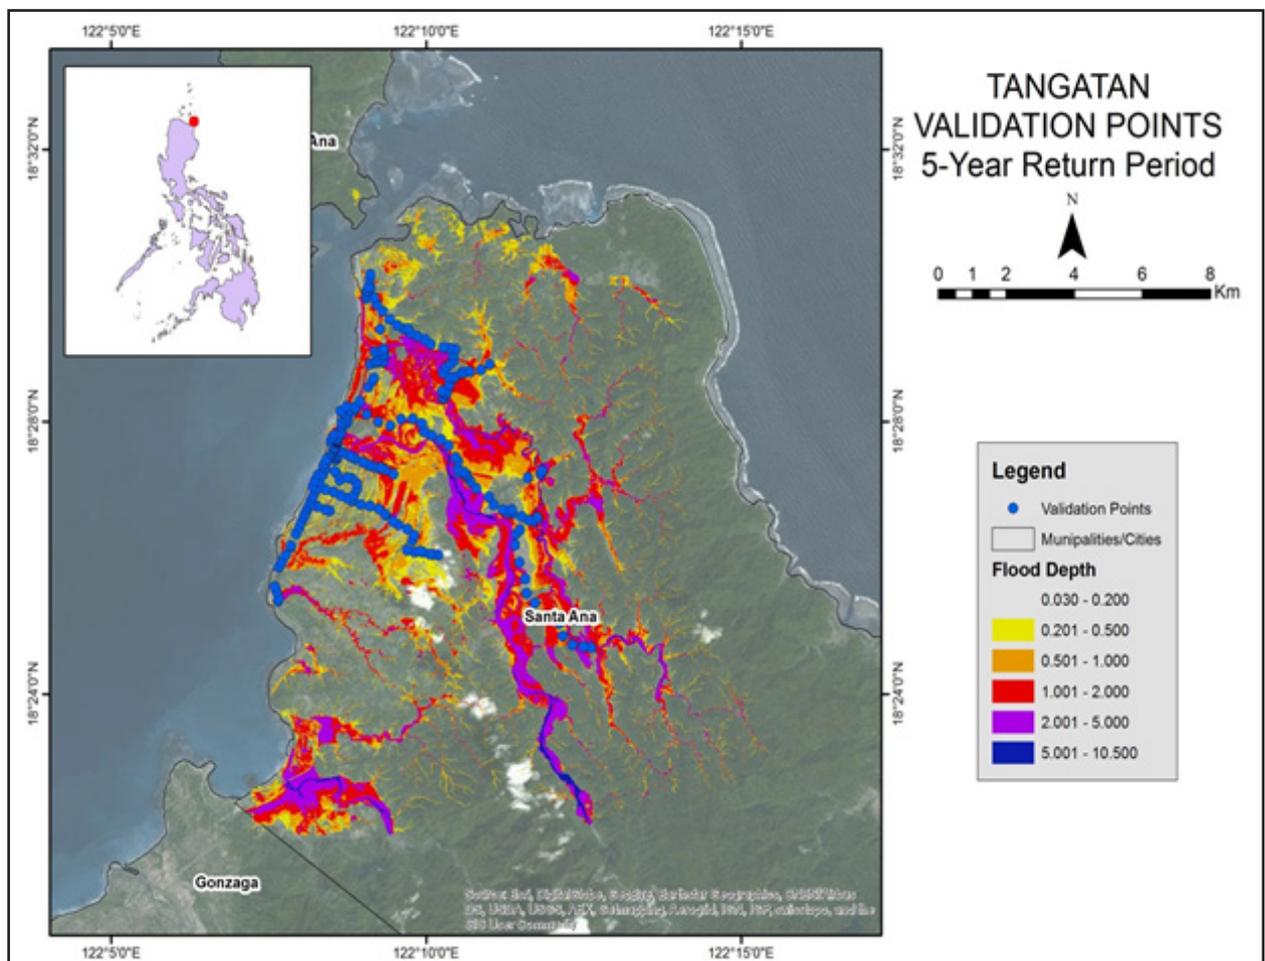

Figure 83. Tangatan Flood Validation Points

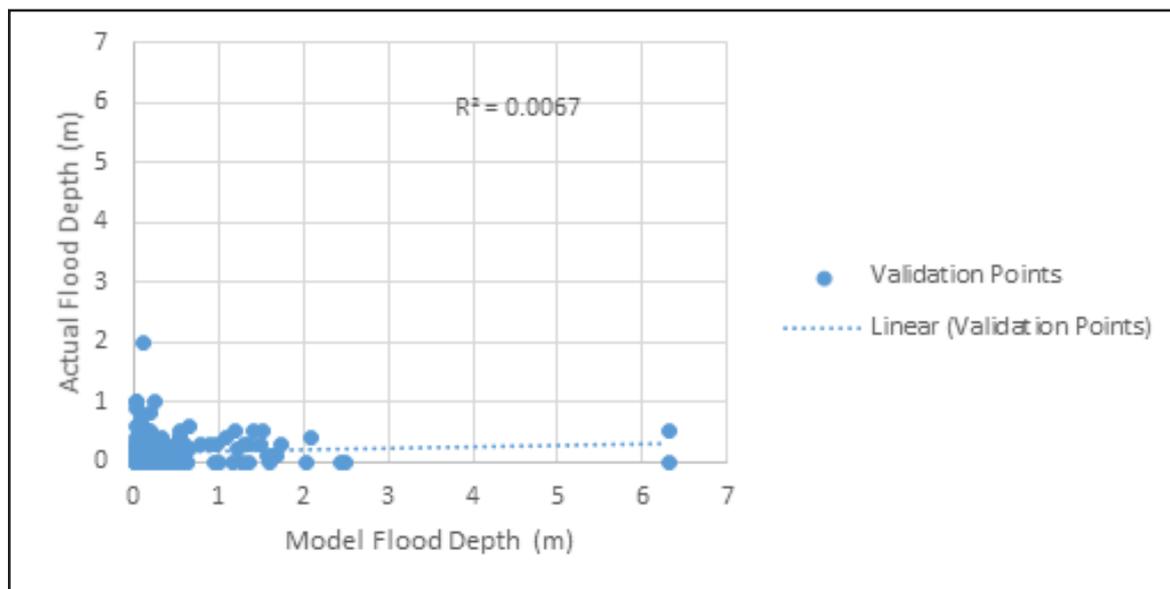

Figure 84. Model flood depth vs actual flood depth

Table 41. Actual Flood Depth vs Simulated Flood Depth in Tangatan

Actual Flood Depth (m)	Modeled Flood Depth (m)						Total
	0-0.20	0.21-0.50	0.51-1.00	1.01-2.00	2.01-5.00	> 5.00	
0-0.20	127	27	12	9	3	1	179
0.21-0.50	12	6	9	8	1	1	37
0.51-1.00	7	1	1	0	0	0	9
1.01-2.00	1	0	0	0	0	0	1
2.01-5.00	0	0	0	0	0	0	0
> 5.00	0	0	0	0	0	0	0
Total	147	34	22	17	4	2	226

The overall accuracy generated by the flood model was estimated at 59.29% with 134 points correctly matching the actual flood depths. In addition, there were 48 points estimated one level above and below the correct flood depths while there were 27 points and 16 points estimated two levels above and below, and three or more levels above and below the correct flood. A total of 4 points were overestimated while a total of 21 points were underestimated in the modelled flood depths of Tangatan.

Table 42. Summary of Accuracy Assessment in Tangatan River Basin Survey.

	No. of Points	%
Correct	134	59.29
Overestimated	71	31.42
Underestimated	21	9.29
Total	226	100.00

ANNEXES

Annex 1. Technical Specifications of the Lidar Sensor Used In The Tangatan Floodplain Survey

Figure A-1.1 Gemini Sensor

Parameter	Specification
Operational envelope (1,2,3,4)	150-4000 m AGL, nominal
Laser wavelength	1064 nm
Horizontal accuracy (2)	1/5,500 x altitude, (m AGL)
Elevation accuracy (2)	<5-35 cm, 1 σ
Effective laser repetition rate	Programmable, 33-167 kHz
Position and orientation system	POS AV™ AP50 (OEM);
Scan width (FOV)	220-channel dual frequency GPS/GNSS/Galileo/L-Band receiver
Scan frequency (5)	Programmable, 0-50°
Sensor scan product	Programmable, 0-70 Hz (effective)
Beam divergence	1000 maximum
Roll compensation	Dual divergence: 0.25 mrad (1/e) and 0.8 mrad (1/e), nominal
Vertical target separation distance	Programmable, $\pm 5^\circ$ (FOV dependent)
Range capture	Up to 4 range measurements, including 1st, 2nd, 3rd, and last returns
Intensity capture	Up to 4 intensity returns for each pulse, including last (12 bit)
Image capture	Internal video camera (NTSC or PAL)
Full waveform capture	Compatible with full Optech camera line (optional)
Data storage	12-bit Optech IWD-2 Intelligent Waveform Digitizer (optional)
Power requirements	Removable solid state disk SSD (SATA II)
Dimensions and weight	28 V; 900 W; 35 A (peak)
	Sensor: 260 mm (w) x 190 mm (l) x 570 mm (h); 23 kg
	Control rack: 650 mm (w) x 590 mm (l) x 530 mm (h); 53 kg
Operating Temperature	-10°C to +35°C (with insulating jacket)
Relative humidity	0-95% no-condensing

Location Description

CGY-102
From Gonzaga, travel along the nat'l. highway to Santa Ana. Station is located about 2 m. from the S corner of the triangular isalnd at the intersection of the nat'l. highway and the road to Port Irene. Mark is the head of a copper nail centered and flushed on a 30 cm. x 30 cm. concrete monument, with inscriptions "CGY-102 2007 NAMRIA".
